May 2013–Revised July 2013

WARNING: EXPORT NOTICE

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from Disclosing party under this Agreement, or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorisation from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws. This provision shall survive termination or expiration of this Agreement.

According to our best knowledge of the state and end-use of this product or technology, and in compliance with the export control regulations of dual-use goods in force in the origin and exporting countries, this technology is classified as follows:

US ECCN: 3E991

EU ECCN: EAR99

And may require export or re-export license for shipping it in compliance with the applicable regulations of certain countries.

PRELIMINARY

Contents

Preface **277**

1 Introduction **287**

1.1 Overview 288
1.2 OMAP5430 Environment 289
1.3 OMAP5430 Description 290
1.3.1 MPU Subsystem Description 292
1.3.2 DSP Subsystem Description 292
1.3.3 IVA-HD Subsystem Description 292
1.3.4 Image Processing Unit (IPU) Subsystem 293
1.3.5 Display Subsystem 294
1.3.6 ABE Subsystem 294
1.3.7 Imaging Subsystem (ISS) 295
1.3.8 3D Graphics Processing Unit (GPU) 296
1.3.9 2D Graphics Accelerator 297
1.3.10 Face Detect Module 297
1.3.11 On-Chip Debug Support 298
1.3.12 Power, Reset, and Clock Management 299
1.3.13 On-Chip Memory 299
1.3.14 Memory Management 299
1.3.15 External Memory Interface Description 299
1.3.16 System and Connection Peripherals 300
1.3.16.1 System Peripherals 300
1.3.16.2 Connectivity Peripherals 300
1.4 OMAP5430 Package-On-Package Concept 302
1.5 OMAP543x Family and Device Identification 303

2 Memory Mapping **305**

2.1 Introduction 306
2.2 L3_MAIN Memory Space Mapping 308
2.2.1 L3_INSTR Memory Space Mapping 311
2.3 L4 Memory Space Mapping 313
2.3.1 L4_CFG Memory Space Mapping 313
2.3.2 L4_WKUP Memory Space Mapping 316
2.3.3 L4_PER Memory Space Mapping 317
2.3.4 L4_ABE Memory Space Mapping 319
2.4 IPU Memory Space Mapping 323
2.5 DSP Subsystem Memory Space Mapping 324
2.6 Display Subsystem Memory Space Mapping 325
2.6.1 L3 Interconnect View of the Display Memory Space 325

3 Power, Reset, and Clock Management **326**

3.1 Device Power Management Introduction 327
3.1.1 Device Power-Management Architecture Building Blocks 327
3.1.1.1 Clock Management 327
3.1.1.1.1 Module Interface and Functional Clocks 327

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

3.1.1.1.2 Module-Level Clock Management 328
3.1.1.1.3 Clock Domain 333
3.1.1.1.4 Clock Domain-Level Clock Management 334
3.1.1.1.5 Clock Domain HW_AUTO Mode Sequences 336
3.1.1.1.6 Clock Domain Sleep/Wake-up 339
3.1.1.1.7 Clock Domain Dependency 339
3.1.1.2 Power Management 345
3.1.1.2.1 Power Domain 345
3.1.1.2.2 Module Logic and Memory Context 347
3.1.1.2.3 Power Domain Management 347
3.1.1.3 Voltage Management 348
3.1.1.3.1 Voltage Domain 349
3.1.1.3.2 Voltage Domain Management 350
3.1.1.3.3 AVS Overview 351
3.1.2 Power-Management Techniques 353
3.1.2.1 Standby Leakage Management 353
3.1.2.2 Dynamic Voltage and Frequency Scaling 353
3.1.2.3 Dynamic Power Switching 354
3.1.2.4 Adaptive Voltage Scaling 355
3.1.2.5 Adaptive Body Bias 355
3.1.2.6 SR3-APG (Automatic Power Gating) 356
3.1.2.7 Combining Power-Management Techniques 356
3.1.2.7.1 DPS Versus SLM 357
3.2 PRCM Subsystem Overview 358
3.2.1 Introduction 358
3.2.2 Power-Management Framework Features 359
3.3 PRCM Subsystem Environment 361
3.3.1 External Clock Signals 361
3.3.2 External Boot Signals 362
3.3.3 External Reset Signals 363
3.3.4 External Power Control Signals 363
3.3.5 External Voltage Inputs 364
3.4 PRCM Subsystem Integration 365
3.4.1 Device Power-Management Layout 365
3.4.2 Power-Management Scheme, Reset, and Interrupt Requests 368
3.4.2.1 Power Domain 368
3.4.2.2 Resets 368
3.4.2.3 Interrupt Requests 369
3.5 Reset Management Functional Description 370
3.5.1 Overview 370
3.5.1.1 SCRM Reset Management Functional Description 370
3.5.1.1.1 Power-On Reset 370
3.5.1.1.2 Warm Reset 370
3.5.1.2 PRM Reset Management Functional Description 370
3.5.2 General Characteristics of Reset Signals 371
3.5.2.1 Scope 371
3.5.2.2 Occurrence 371
3.5.2.3 Source Type 371
3.5.2.4 Retention Type 372
3.5.3 Reset Sources 372
3.5.3.1 Global Reset Sources 372
3.5.3.2 Local Reset Sources 373
3.5.4 Reset Domains 373

PRELIMINARY

3.5.5 Reset Logging 390
3.5.5.1 PRCM Module Reset Logging Mechanism 390
3.5.6 Reset Sequences 390
3.5.6.1 SCRM Power-On Reset Sequence 390
3.5.6.2 PRCM Module Power-On Reset Sequence 391
3.5.6.3 MPU Subsystem Power-On Reset Sequence 393
3.5.6.4 MPU Subsystem Warm Reset Sequence 394
3.5.6.5 MPU Subsystem Reset Sequence on Sleep and Wake-Up Transitions From RETENTION and OFF States 395
3.5.6.6 IVA Subsystem Power-On Reset Sequence 396
3.5.6.7 IVA Subsystem Software Warm Reset Sequence 397
3.5.6.8 DSP Subsystem Power-On Reset Sequence 398
3.5.6.9 DSP Subsystem Software Warm Reset Sequence 399
3.5.6.10 IPU Subsystem Power-On Reset Sequence 399
3.5.6.11 IPU Subsystem Software Warm Reset Sequence 400
3.5.6.12 Global Warm Reset Sequence 401
3.6 Clock Management Functional Description 404
3.6.1 Overview 404
3.6.2 External Clock Inputs 404
3.6.2.1 sys_32k Clock Input 404
3.6.2.2 High-Frequency System Clock Input 405
3.6.3 Internal Clock Sources/Generators 405
3.6.3.1 PRM Clock Source 405
3.6.3.1.1 CD_PRM_TIMER Overview 407
3.6.3.2 CM Clock Source 408
3.6.3.2.1 CM_CORE_AON Clock Generator 408
3.6.3.2.2 CKGEN_USB Clock Generator 410
3.6.3.2.3 CKGEN_ABE Clock Generator 412
3.6.3.2.4 CKGEN_ISS Clock Generator 414
3.6.3.2.5 CM_CORE Clock Generator 415
3.6.3.3 Generic DPLL Overview 418
3.6.3.3.1 DPLLs Output Clocks Parameters 419
3.6.3.3.2 Enable Control, Status, and Low-Power Operation Mode 421
3.6.3.3.3 DPLL Power Modes 421
3.6.3.3.4 DPLL Recalibration 423
3.6.3.3.5 DPLL Spread Spectrum Clocking 424
3.6.3.3.6 DPLL Output Power Down 431
3.6.3.4 DPLL_PER Description 432
3.6.3.4.1 Overview 432
3.6.3.4.2 Synthesized Clock Parameters 432
3.6.3.4.3 Power Modes 433
3.6.3.4.4 Recalibration 433
3.6.3.4.5 Spread Spectrum Clocking 433
3.6.3.5 DPLL_CORE Description 434
3.6.3.5.1 Overview 434
3.6.3.5.2 Synthesized Clock Parameters 434
3.6.3.5.3 Power Modes 435
3.6.3.5.4 Recalibration 435
3.6.3.5.5 Spread Spectrum Clocking 435
3.6.3.6 DPLL_ABE Description 436
3.6.3.6.1 Overview 436
3.6.3.6.2 Synthesized Clock Parameters 436
3.6.3.6.3 Power Modes 437
3.6.3.6.4 Recalibration 437

PRELIMINARY

3.6.3.6.5 Spread Spectrum Clocking 437
3.6.3.7 DPLL_MPU Description 437
3.6.3.7.1 Overview 437
3.6.3.7.2 Tactical Clocking Adjustment 438
3.6.3.7.3 Synthesized Clock Parameters 438
3.6.3.7.4 Power Modes 438
3.6.3.7.5 Recalibration 439
3.6.3.7.6 Spread Spectrum Clocking 439
3.6.3.8 DPLL_IVA Description 439
3.6.3.8.1 Overview 439
3.6.3.8.2 Synthesized Clock Parameters 440
3.6.3.8.3 Power Modes 440
3.6.3.8.4 Recalibration 441
3.6.3.8.5 Spread Spectrum Clocking 441
3.6.3.9 DPLL_USB Description 441
3.6.3.9.1 Overview 441
3.6.3.9.2 Synthesized Clock Parameters 442
3.6.3.9.3 Power Modes 442
3.6.3.9.4 Spread Spectrum Clocking 443
3.6.3.10 DPLLs Cascading 443
3.6.4 CD_WKUPAON Clock Domain 445
3.6.4.1 Overview 445
3.6.4.2 Specific properties and signals. 445
3.6.4.3 Clock Domain Modes 446
3.6.4.4 Clock Domain Dependency 446
3.6.4.4.1 Wake-Up Dependency 446
3.6.4.5 Clock Domain Module Attributes 447
3.6.5 CD_DSP Clock Domain 449
3.6.5.1 Overview 449
3.6.5.2 Clock Domain Modes 449
3.6.5.3 Clock Domain Dependency 450
3.6.5.3.1 Static Dependency 450
3.6.5.3.2 Dynamic Dependency 450
3.6.5.4 Clock Domain Module Attributes 450
3.6.6 CD_CUSTEFUSE Clock Domain 451
3.6.6.1 Overview 451
3.6.6.2 Clock Domain Modes 452
3.6.6.3 Clock Domain Dependency 452
3.6.6.4 Clock Domain Module Attributes 452
3.6.7 CD_MPU Clock Domain 453
3.6.7.1 Overview 453
3.6.7.2 Clock Domain Modes 453
3.6.7.3 Clock Domain Dependency 454
3.6.7.3.1 Static Dependency 454
3.6.7.3.2 Dynamic Dependency 455
3.6.7.4 Clock Domain Module Attributes 455
3.6.8 CD_L4_PER Clock Domain 456
3.6.8.1 Overview 456
3.6.8.2 Clock Domain Modes 456
3.6.8.3 Clock Domain Dependency 457
3.6.8.3.1 Dynamic Dependency 457
3.6.8.3.2 Wake-Up Dependency 457
3.6.8.4 Clock Domain Module Attributes 462

About This Manual

FCC Warning

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

Information About Cautions and Warnings

This book may contain cautions and warnings.

CAUTION

This is an example of a caution statement.

A caution statement describes a situation that could potentially damage your software or equipment.

WARNING

This is an example of a warning statement.

A warning statement describes a situation that could potentially cause harm to you.

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

Register, Field, and Bit Calls

The naming convention applied for a call consists of:

- For a register call: *<Module name>.<Register name>*; for example: UART.UASR
- For a bit field call:
  - *<Module name>.<Register name>[End:Start] <Field name> field*; for example, UART.UASR[4:0] SPEED bit field
  - *<Field name> field <Module name>.<Register name>[End:Start]*; for example, SPEED bit field UART.UASR[4:0]
- For a bit call:
  - *<Module name>.<Register name>[pos] <Bit name> bit*; for example, UART.UASR[5] BIT_BY_CHAR bit
  - *<Bit name> bit <Module name>.<Register name>[pos]*; for example, BIT_BY_CHAR bit UART.UASR[5]

To help the reader navigate the document, each register call is hyperlinked to its register description in the register manual section. After each register description, a table summarizes all hyperlinked register calls.

To navigate in the PDF documents, see Acrobat Reader Tips.

Coding Rules

The programming models or code listings follow the rules:

Type	Definition	Example
File	Starts with the module name	PRCM_test1.c MCBSP1_init.h
Variable	Global variables are prefixed by "g_" Pointers are prefixed by "p" Global pointers are prefixed by "g_p"	g_SDMA_LogicalChan pAddrCounter g_pSDMA_LogicalChan
Function	Starts with the module name	PRCM_SetupClocks() ArmIntC_MaskInterrupts()
Typedef	Ends with "_t"	PRCM_Struct_t
Definition	Starts with the module name and is followed by the register name	#define SMS_ERR_TYPE *((volatileUint32*)0x680080F4) #define MCBSP2_RCR1_REG *((volatile Uint32*)0x4807401C)
Enumeration	Starts with the module name	Typedef enum DMA_Mode_Label { INPUT_MODE OUTPUT_MODE } DMA_Mode_t;

Flow Chart Rules

Flow charts follow the following rules:

Shape	Name	Definition
	Process	Any computational steps or processing function of a program; defined operation(s) causing change in value, form, or location of information
	Decision	A decision or switching-type operation that determines which of a number of alternate paths is followed
	Predefined process or sub-process	One or more named operations or program steps specified in a subroutine or another set of flow charts
	Data or I/O	General I/O function; information available for processing (input) or recording of processed information (output)
	Terminator	Terminal point in a flow chart: start, stop, halt, delay, or interrupt; may show exit from a closed subroutine
	Annotation	Additional descriptive clarification, comment
	On page connector (reference)	Exit to, or entry from, another part of chart in the same page
	Off page connector (reference)	The flow continues on a different page.
	Summing Junction	Logical AND
	Or	Logical OR
	Parallel mode (ISO)	Beginning or end of two or more simultaneous operations
	Flow Line	Lines indicate the sequence of steps and the direction of flow.

Acrobat Reader Tips

Acrobat includes two methods to search for words in a PDF:

- The Find toolbar provides a basic set of options to locate a word in the current PDF.
- The Search window lista words or partial words that match your text in the current PDF.

These guidelines apply to Acrobat Reader 5.x, 6.0, and 7.0.

For more information on Acrobat Reader search features, see the Adobe Reader Help.

To search for words in a document using the Find dialog box:

1. Open the document.
2. To display the Find toolbar, right-click in the toolbar area and select Find.
3. In the Find box, type the word, words, or partial words for which you want to search.
4. From the Find Options menu, select options as desired.
5. To view each search result, click the Find toolbar, the Find Previous button, or the Find Next button to go backward or forward through the document.

To search for words in a document using the Search PDF window:

1. Open the document.
2. Click the Search button on the File toolbar or right-click on your document and select Search.
3. Type the word, words, or part of a word for which you want to search.
4. Click Search.
5. The results appear in page order and, if applicable, show a few words of context. Each result displays an icon to identify the type of occurrence. All other searchable areas display the Search Result icon.
6. To display the page that contains a search result, click an item in the Results list. The occurrence is highlighted.
7. To navigate to the next result, choose Edit > Search Results > Next Result (or Ctrl+G).
8. To navigate to the previous result, choose Edit > Search Results > Previous Result (or Shift+Ctrl+G).

Navigate through your previous view

To retrace your path within an Adobe PDF document:

- For the previous view: Choose View > Go To > Previous View or Alt+Left Arrow.
- For the next view: Choose View > Go To > Next View or Alt+Right Arrow. The Next View command is available only if you have chosen Previous View.

  If you view the PDF document in a browser, use options on the Navigation toolbar to move between views.
  - Right-click the toolbar area, and then choose *Navigation*.
  - Click the Go To Previous View button or the Go To Next View button.

NOTE: This navigation tip is useful to return to your previous view after clicking on a register call hyperlink.

1.1 Overview

The OMAP543x high-performance multimedia application device is based on enhanced OMAP™ architecture and uses 28-nm technology.

- The architecture is designed to provide best-in-class CPU performance, video, image, and graphics processing for a broad range of multimedia-rich applications. The device supports the following functions:
  - Streaming video up to full high definition (Full-HD) (1920 × 1080p, 60 fps)
  - Stereoscopic video recording and playback up to Full-HD (1920 × 1080p, 30 fps)
  - 2-dimensional (2D)/3-dimensional (3D) gaming and video contents
  - Video conferencing
  - High-resolution still image (up to 24 MP)
  - Full-HD video capture and encode (1920 × 1080 resolution)
  - Efficient support for web browsing
- The device supports high-level operating systems (OS) such as:
  - Android™
  - Linux®

  and others.
- The device is composed of the following major subsystems:
  - Cortex™-A15 microprocessor unit (MPU) subsystem, including two ARM® Cortex-A15 cores
  - Digital signal processor (DSP) subsystem
  - Image and video accelerator high-definition (IVA-HD) subsystem
  - Cortex™-M4 image processing unit (IPU) subsystem, including two ARM Cortex-M4 microprocessors
  - Display subsystem
  - Audio back-end (ABE) subsystem
  - Imaging subsystem (ISS), consisting of image signal processor (ISP) and still image coprocessor (SIMCOP) block
  - 3D-graphics accelerator subsystem, including POWERVR™ SGX544 dual-core
  - Debug subsystem
- The device includes state-of-the-art power management techniques required for high-performance mobile products.
- Comprehensive power management is integrated into the device.
- The device also integrates:
  - On-chip memory
  - External memory interfaces
  - Memory management
  - Level 3 (L3) and level 4 (L4) interconnects
  - System and connecting peripherals

1.2 OMAP5430 Environment

This section provides an overview of the OMAP5430 high-tier environment. See more information about the OMAP5432 device in Appendix A, *OMAP5432 Multimedia Device*.

The device is associated with power-management companion and audio companion integrated circuits (ICs). TI provides a global solution with the TWL6035/TWL6037 power-management- and TWL6041 audio-companion devices.

Figure 1-1 is an overview of a nonexhaustive environment for the high-tier OMAP5430 device.

Figure 1-1. OMAP5430 High-Tier Environment

1.3 OMAP5430 Description

The subsystems described in the current subsection apply to the OMAP5430 high-tier device. For more information about the OMAP5432 device see Appendix A, *OMAP5432 Multimedia Device.*

The OMAP5430 device is offered in a 980-ball, 14 × 14 -mm, 0.4-mm bottom ball pitch package. Some balls (240 balls, 0.5-mm pitch) are available at the top of the device to allow LPDDR2 memory stacking.

Figure 1-2 is the block diagram of the OMAP5430 device.

1.3.1 MPU Subsystem Description

The Cortex-A15 MPU subsystem integrates the following submodules:

- ARM Cortex-A15 MPCore
  - Two central processing units (CPUs)
  - ARM Version 7 ISA: Standard ARM instruction set plus Thumb®-2, Jazelle® RCT Java™ accelerator, hardware virtualization support, and large physical address extensions (LPAE)
  - Neon™ SIMD coprocessor and VFPv4 per CPU
  - Interrupt controller with up to 160 interrupt requests
  - One general-purpose timer and one watchdog timer per CPU
  - Debug and trace features
  - 32-KiB instruction and 32-KiB data level 1 (L1) caches per CPU
- Shared 2-MiB level 2 (L2) cache
- 48-KiB bootable ROM
- Local power, reset, and clock management (PRCM) module
- Emulation features
- Digital phase-locked loop (DPLL)

1.3.2 DSP Subsystem Description

The DSP subsystem contains the following submodules:

- TMS320DM64™ 32-bit fixed DSP core for audio processing and general-purpose imaging and video processing. It is backward compatible with existing C64x™ video codecs.
  - 32-KiB L1 4-way set associative cache
  - 128-KiB L2 8-way set associative cache
- Enhanced direct memory access (DMA_DSP) engine with 128 channels for video/audio data transfer between IVA3 local memories and external SDRAM memories or peripherals
- Interrupt controller (INTC) with up to 128 interrupt requests
- Memory management unit (MMU) for address management. It translates virtual addresses handled by the DSP CPU into physical addresses.
- DPLL

The DSP subsystem allows direct access to the ABE subsystem, and has emulation capabilities.

1.3.3 IVA-HD Subsystem Description

The IVA-HD subsystem is a set of video encoder/decoder hardware accelerators that supports:

- Real-time video encoding and decoding
- MPEG4/H264 up to 1920 × 1080p @ 60 fps
- MPEG2 decoding up to 1920 × 1080p @ 60 fps
- Supporting JPEG encode/decode up to 96 MP/s

The IVA-HD subsystem is composed of:

- Improved motion estimation acceleration engine (IME3), which is used in encoding processing
- Improved loop filter acceleration engine (ILF3), which performs deblocking filtering
- Improved sequencer (ICONT1) based on the ARM968E-S™ microcontroller. It includes memory and INTC and is used as a primary sequencer.
- Intraprediction estimation engine (IPE3). It is used in encoding processing.
- Calculation engine (CALC3), which performs transform and quantization calculations
- Motion compensation engine (MC3), which creates an interprediction macroblock with given motion vectors and modes from the reference data
- Entropy coder/decoder (ECD3), which uses Huffman and arithmetic codes during the process of

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

encoding and decoding the stream

- Video DMA processor (ICONT2), which is also based on the ARM968E-S microcontroller and can be used as secondary sequencer
- Video DMA engine (vDMA), which is a DMA engine for data transmission between external memories and shared L2 memory
- Synchronization box (SYNCBOX) embedded in each hardware accelerator and in both ICONTs
- Mailbox for communication between IVA-HD and external to it processors (DSP, MPU, and IPU)
- Shared L2 interface and memory
- Video local interconnect for connection between the submodules of the IVA-HD
- IVA-HD system control module (SYSCTRL), which controls the clocks in the subsystem and PRCM handshaking

The IVA-HD subsystem can process three data formats for internal data: picture or slice, macroblock header, and residual data.

The IVA-HD supports the following formats:

- MPEG-1/-2/-4 such as MPEG-2 MP, HP, and MPEG-4 as SP/ASP
- DivX 5.02 and above
- Sorenson Spark (decode)
- H.263 P0 (encode and decode) and P3 (decode)
- H.264 Annex G (scalable baseline profile up to 720p)
- H.264 BL/MP/HP
- H.264 Annex H (partial)
- Stereoscopic video
- JPEG (encode/decode)
- VC-1 SP/MP/AP
- AVS-1.0
- RealVideo® 8/9/10 (decode only)
- On2® VP6.2/VP7 (decode only)

1.3.4 Image Processing Unit (IPU) Subsystem

The Cortex-M4 IPU subsystem includes the following components:

- Two Cortex-M4 CPUs
- ARMv7E-M and Thumb-2 instruction set architecture
- Hardware division and single-cycle multiplication acceleration
- Dedicated INTC with up to 63 physical interrupt events with 16-level priority
- Two-level memory subsystem hierarchy
  - L1
    32-KiB shared cache memory
  - L2 ROM + RAM
    - 64-KiB RAM
    - 16-KiB bootable ROM
- Cortex-M4 system bus directly connected to the ISS interconnect
- MMU for address translation
- Integrated power management
- Emulation feature embedded in the Cortex-M4

PRELIMINARY

1.3.5 Display Subsystem

The display subsystem provides the control signals required to interface the OMAP system memory frame buffer (SDRAM) directly to the displays. It supports hardware cursor, independent gamma curve on all interfaces, multiple-buffer, and programmable color phase rotation. The display subsystem allows low-power display refresh and arbitration between normal and low-priority pipelines.

The display subsystem consists of the following sections:

- **Display controller:** Reads and displays the encoded pixel data stored in memory and writes the output of one of the overlays or one of the pipelines into the system memory. The display controller supports the following components:
  - Three video pipelines, one graphic pipeline, and one write-back pipeline. The graphic pipeline supports pixel formats such as: ARGB16-4444, RGB16-565, ARGB16-1555, ARGB32-8888, RGBA32-8888, RGB24-888, and BITMAP (1, 2, 4, or 8 bits per pixel). It allows selection of the color-depth expansion.
  - Write-back pipeline: Uses poly-phase filtering for independent horizontal and vertical resampling (upsampling and downsampling). It allows programmable color space conversion of RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, or YUV4:2:0-NV12 or NV21, and selection of color-depth reduction from RGB24 to RGB16.
  - Three LCD outputs, each one with dedicated overlay manager, for support of active matrix color displays (up to 24-bit interface).
  - One TV output with dedicated overlay manager to support HDMI video port
  - All outputs (three LCDs and one TV), besides other interfaces, are available through the parallel CMOS interface for MIPI®-DPI 2.0 support.
  - Own direct memory access (DMA) engine
- **Remote frame buffer interface (RFBI) module:**
  - Support for MIPI-DBI protocol
  - 8-/9-/12-/16-bit parallel interface
  - Programmable pixel modes and output formats
- **Two MIPI display serial interfaces (DSI)** with the following main features:
  - Support for MIPI-DSI v01.01.00 (four data-lane complex I/Os)
  - Support for video mode and command mode
  - Data interleaving support for synchronous and asynchronous streams
  - Bidirectional data link support
- **High-definition multimedia interface (HDMI) encoder** with the following main features:
  - HDMI 1.4a, HDCP 1.4, and DVI 1.0 compliant

    Includes support for the 3D stereoscopic frame-packing formats of HDMI v1.4a standard (720p, 50 Hz; 720p, 60 Hz; 1080p, 30 Hz; and side-by-side half structure: 1080p, 60 Hz)
  - Deep-color mode support (10 bit for up to 1080p and up to 12 bit for 1080i/720p)
  - Expanded support for color spaces (xvYCC601, xvYCC709, sYCC601, AdobeYCC601, and AdobeRGB)
  - Support for uncompressed multichannel audio
  - Integrated high-bandwidth digital content protection (HDCP) encryption engine for transmitting protected audio and video content
  - Integrated transition minimized differential signaling (TMDS) and TERC4 encoders for data island support

1.3.6 ABE Subsystem

The ABE subsystem handles audio processing for the application. It manages the audio and voice streams between the MPU subsystem and/or DSP, and the physical interfaces.

The ABE subsystem allows:

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

- Buffering of audio samples
- Mixing audio with voice downstream and/or microphone upstream (sidetone)
- Postprocessing of equalization, 3D effects, bass-boost

The ABE subsystem consists of:

- Audio engine (AE) subsystem, which performs real-time signal processing such as:
  - Muxing and mixing voice and data streams
  - Postprocessing operations such as sampling rate conversion, volume control, smooth muting, side tone equalization, 3D effects, bass-boost
  - Execution of whole data transfers in the ABE subsystem using audio traffic controller (ATC)

    The AE subsystem includes an AE and has the following on-chip memories available: 64-KiB data memory (DMEM); 6-KiB coefficient memory (CMEM); and 18-KiB sample memory (SMEM).

    The ATC manages the data movement in the ABE subsystem and is in charge of interrupt generation to the DSP and MPU subsystems.
- Four general-purpose timers and one watchdog timer
- Peripheral interfaces:
  - Three multichannel buffered serial ports (MCBSP) for inter-IC sound (I^2S™) external connectivity
  - One multichannel audio serial port (MCASP) supporting Sony/Philips digital interconnect format (S/PDIF) output, and four-channel I^2S in either direction
  - One digital microphone controller (DMIC) for three stereo digital microphones support
  - One multichannel pulse-density modulation (MCPDM) interface, which ensures communication with the TWL6041 audio companion chip
- Internal interfaces for connection with the DSP and MPU subsystems and other modules in the device

1.3.7 Imaging Subsystem (ISS)

The ISS processes data coming from the image sensor, memory, and IVA-HD subsystem. The ISS is responsible for multimedia applications such as: camera viewfinder; video record with up to 1080p at 60 fps or stereoscopic record up to 1080p at 30 fps with digital zoom, video stabilization, rotation and auto-convergence. The ISS supports a pixel throughput of up to 304 MP/s. It assures good performance with sensors up to 24 MP and more (higher resolution can be achieved using vertical frame division mode). ISS supports still image capture during video record. The ISS can implement third-party algorithms for further flexibility when working with image sensors.

The ISS consists of:

- The ISP, which deals with on-the-fly or memory-to-memory data processing. It allows data collection for autoexposure, autowhite balance, autofocus, resizing, and histogram generation. The ISP consists of:
  - Image pipe interface (IPIPEIF) for synchronization signals (HD, VD) for the ISIF, IPIPE, RSZ, and hardware 3A (H3A) modules, and data transfer from video port, SDRAM, ISIF. Various pixel data manipulation functions.
  - Image pipe (IPIPE) front-end and back-end modules for raw data processing and RGB and YUV data processing, respectively. They support:
    - Sensor data linearization for dynamic range extension
    - Programmable 2D lens shading compensation correction
    - Black-level compensation
    - Defect pixel correction (LUT_DPC) with look-up table
    - Defect pixel correction (OTF_DPC) with on-the-fly detection and correction
    - Green imbalance correction (GIC)
    - Gamma correction
    - RGB color correction
    - RGB to YUV4:2:2 color conversion

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

- 3D look up table (LUT) for color correction
- 2D noise filtering
- 2D edge enhancement
- False chroma suppression

– H3A for autowhite balance, autoexposure, and autofocus

– Two independent resizers, which allow YUV4:2:2 to YUV4:2:0 planar chroma filtering and downsampling. The resizers support input and output flows with up to 304 MP/s, and memory-to-memory rescaling in the range ×1/4096 scale down, and ×20 scale up. RGB565, ARGB888, YUV422 co sited and YUV4:2:0 planar (NV12 or NV21) data output.

– Image sensor interface (ISIF) can process the incoming data and supports the following main functions:

- Sensor data linearization
- Supports VGA read out mode
- Color space conversion
- Digital clamp with horizontal/vertical offset drift compensation
- Vertical line defect correction
- Programmable 2D-matrix lens shading correction
- 10-to-8 bits A-Law compression table inside

– Buffer logic (BL), which processes and manages the requests to the module and memory subsystem

- Peripheral serial interfaces for connection with sensors and memories:
  – One MIPI CSI-2 compliant with four RX data lanes
  – One MIPI CSI-2 compliant with two RX data lanes
  – One MIPI CSI-2 compliant with one RX data lane / MIPI CSI-1 / CCP2
- Peripheral 16-bit parallel interface, BT656 and SYNC mode
- SIMCOP coprocessor for memory-to-memory operation; JPEG encode/decode hardware acceleration; high-ISO filtering; block-based rotation; warping and fusion; and general-purpose imaging acceleration. The SIMCOP includes the following main submodules:
  – Two imaging extension (iMX) modules – programmable image and video processing engines
  – Noise filter 2 (NSF2) – for advanced noise filtering and edge-enhancement
  – Noise filter 3 (NSF3) – next generation NSF for advanced noise filtering and edge-enhancement, supporting Bayer RGB format
  – Variable-length coder/decoder for JPEG (VLCDJ) module
  – Discrete cosine transform (DCT) module
  – Warping accelerator for lens distortion correction (LDC) and chromatic aberration correction
  – Rotation accelerator (ROT) engine
  – Hardware sequencer, which offloads sequencing tasks from the MPU
  – Shared buffers/memories
  – DMA controller
- Timing control module for CAM global reset control, CAM flash strobe, and CAM shutter
- Bayer scaler module allowing low latency still image capture and stabilization statistics collection.

1.3.8 3D Graphics Processing Unit (GPU)

The 3D graphics processing unit subsystem is based on POWERVR® SGX544 subsystem from Imagination Technologies. It supports phone/PDA and handheld gaming applications. The GPU can process different data types simultaneously, such as: pixel data, vertex data, video data, and general-purpose data processing.

The GPU subsystem has the following features:

Copyright © 2013, Texas Instruments Incorporated

PRELIMINARY

- Multicore GPU architecture: two SGX544 cores. Shared system level cache of 128 KiB
- Tile-based deferred rendering architecture
- Second-generation universal scalable shader engines (USSE2), multithreaded engines incorporating pixel and vertex shader functionality
- Present and texture load accelerators
  - Enables to move, rotate, twiddle and scale texture surfaces.
  - Supports RGB, ARGB, YUV422 and YUV420 surface formats
  - Supports bilinear upscale
  - Supports source colorkey
- Industry-standard API supports DirectX® 9, OpenGL®-ES 1.1 and 2.0, OpenVG™ 1.1, and OpenCL™1.1 Embedded Profile
- Fine-grained task switching, load balancing, and power management
- Programmable high-quality image antialiasing
- Bilinear, trilinear, anisotropic texture filtering
- Advanced geometry DMA driven operation for minimum CPU interaction
- Fully virtualized memory addressing for OS operation in a unified memory architecture (MMU)

1.3.9 2D Graphics Accelerator

The 2D graphics accelerator (BB2D) subsystem is based on the GC320 2D core from Vivante® Corporation and has the following features:

- API support:
  - OpenWF™, DirectFB
  - GDI/DirectDraw
  - Adobe® Flash®
- BB2D architecture:
  - BitBlt and StretchBlt
  - DirectFB hardware acceleration
  - ROP2, ROP3, ROP4 full alpha blending and transparency
  - Clipping rectangle support
  - Alpha blending includes Java 2 Porter-Duff compositing rules
  - 90-, 180-, 270-degree rotation on every primitive
  - YUV-to-RGB color space conversion
  - Programmable display format conversion with 14 source and 7 destination formats
  - High-quality 9-tap, 32-phase filter for image and video scaling at 1080p
  - Monochrome expansion for text rendering
  - 32 K × 32 K coordinate system

1.3.10 Face Detect Module

The face detect module is a stand-alone module that performs face detection and tracking on a picture stored in the SDRAM memory. It communicates with the MPU, DSP, and IPU subsystems.

Face detect is typically assists:

- Video encoding
- Face-based priority auto-focusing
- Red-eye removal

The face detect module comprises:

- Face detection core with embedded DMA engine for data memory access

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

- RAM and ROM memories
- L3 and L4 port interfaces

1.3.11 On-Chip Debug Support

The on-chip debug support has the following features:

- Multiprocessor debugging lets users control multiple CPU cores embedded in the device, such as:
  - Global starting and stopping of individual or multiple processors
  - Each processor can generate triggers that can be used to alter the execution flow of other processors
  - System clocking and power down
  - Interconnection of multiple devices
  - Channel triggering
- Target debugging, using IEEE1149.1 (JTAG®), or IEEE1149.7 (complementary superset of JTAG) port
- Reduction of power consumption in normal operating mode
- Real-time software trace allows the OMAP software masters to transmit trace data from OS processes or tasks on 256 different channels.

The debug subsystem includes:

- IEEE1149.7 adapter
- Generic TAP for emulation and test control (ICEPick-D™)
- Debug access port (DAP)
- Processor trace subsystem
- System trace subsystem
- EMU configuration interconnect
- Cross-triggering unit (XTRIGGER)
- Debug resource manager (DRM)

ICEMelter:

Controls the wake-up and power-down of the emulation power domain

CORE instrumentation (L3_INSTR) interconnect:

- Initiator ports:
  - L3 interconnect (for software instrumentation and performance probes)
  - OCP-WP
  - IVA-HD instrumentation (HWA profiling)
  - CM2 instrumentation
- Target port:
  - EMU instrumentation (L3_INSTR_EMU) interconnect

OCP watch-point (OCP-WP):

- Monitors L3 interconnect transaction when target transaction attributes match the user-defined attributes or trigger on external debug event
- Only one instance, shared among the following L3 targets:
  - GPMC
  - L4_PER
  - L4_CFG
  - DMM_P1 (DMM target port 1)
  - DMM_P2 (DMM target port 2)
  - OCMC_RAM

Power management events profiler (PM instrumentation)

Clock management events profiler (CM instrumentation)

Statistics collector (performance probes)

1.3.12 Power, Reset, and Clock Management

The PRCM module allows efficient control of clocks and power according to the required performance, and reduction of power consumption.

The PRCM module is divided into:

- Power and reset management (PRM), based on the SmartReflex™ framework with the following features:
  - Dynamic clock gating
  - Dynamic voltage and frequency scaling (DVFS)
  - Dynamic power switching (DPS)
  - Static leakage management (SLM)
  - Adaptive body bias (ABB)
- Clock management part 1 (CM_CORE_AON) for clock generation, distribution, and management for the MPU, DSP, ABE, and CORE always-on power domains. The clock management allows reduction of dynamic consumption.
- Clock management part 2 (CM_CORE) for clock generation, distribution, and management for other modules.

1.3.13 On-Chip Memory

The on-chip memory is divided into L3 OCM RAM, SAR RAM, and memories in the subsystems (MPU, DSP, IPU, ABE, and IVA-HD).

- The L3 OCM RAM consists of 128 KiB of on-chip SRAM.
-
- The SAR RAM is used by device ROM code to store the software booting configuration: a logical structure that allows the redefinition of the ROM code default settings when booting after a warm reset.

1.3.14 Memory Management

The memory management is performed from:

- sDMA controller with up to 127 requests, 32 prioritizable logical channels, and 256 × 64-bit FIFO dynamically allocable between active channels
- Dynamic memory management (DMM) module, which performs global address translation, address rotation (tiling), and access interleaving between the two EMIF channels.

1.3.15 External Memory Interface Description

- The SDRAM memory controller (EMIF) allows:
  - Connection between the device and LPDDR2- or DDR3-type of memories. Supported memory depends on device and its package; see Section 1.5, *OMAP543x Family and Device Identification.*
  - Dual-port controller for efficient memory access
  - 32-bit data path, two chip-selects per memory port controller
  - Memory density up to 2 GiB supported per chip-select providing a total SDRAM space of 8 GiB addressable by the MPU extended address range.
- The general-purpose memory controller (GPMC) supports connection with:
  - Asynchronous SRAM memories
  - Asynchronous/synchronous NOR flash memories
  - NAND flash memories

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

  - Pseudo-SRAM devices
- Two HS-MMC/SD initiator controllers:
  - Support JEDEC JESD64 v4.4.1 and SD3.0 physical layer with SDA3.00 standards
  - Each controller includes its DMA controller compliant to ADMA2 (SDA3.00 Part A2 DMA controller)
  - One controller with 8-bit interface for JC64 memories with dual voltage I/Os (1.2/1.8 V). One controller with a 4-bit interface for external card support with embedded dual voltage I/Os (1.8/3V)
- SATA interface for solid-state drive (SSD) or hard-disk drive (HDD) mass storage. Supports one HBA port with SATA-2 generation speed of 3 Gbps.

1.3.16 System and Connection Peripherals

The OMAP device supports a comprehensive set of peripherals to provide flexible and high-speed interfacing and on-chip programming resources.

1.3.16.1 System Peripherals

- Seven general-purpose timers (TIMER)
- One watchdog timer (WD_TIMER)
- One 32-kHz synchronization timer (COUNTER_32K)
- System control module, which contains registers for the following functions:
  - Static device configuration
  - Debug and observability
  - Status
  - Pad configuration
  - I/O configuration
  - eFuse logic
  - Analog function control
  - System boot decoding logic
- System mailbox with eight mailbox message queues
- One SPINLOCK module with 32 hardware semaphores, which can service tasks between the MPU, DSP, and IPU subsystems

1.3.16.2 Connectivity Peripherals

- Five universal asynchronous receiver/transmitter (UART) modules as serial-communication interfaces
- One UART + IrDA SIR up to FIR + TV remote control interface (CIR)
- Six HS I^2C controller modules; five of them are general-purpose modules with rates up to 3.4 Mbps, and the sixth one, in the PRCM module, performs dynamic voltage control and power sequencing with an external power IC.
- HDQ™/1-Wire® – Benchmarq HDQ and Dallas Semiconductor 1-Wire protocols interface
- Three HS MMC/SD/SDIO modules with 4-bit data bus interface
- Eight general-purpose input/output (GPIO) modules with 32 I/Os each
- One keyboard controller, which supports up to 9 × 9 matrix keypads
- Four multichannel serial peripheral interface (MCSPI) modules
- One single-port SuperSpeed universal serial bus (USB) Dual-Role-Device (DRD) module with embedded PHYs, compliant with the USB2.0 (up to 480 Mbps) and USB3.0 (5 Gbps) standard for HS and SS functions
- One high-speed (HS) multiport USB host module, which can be used for interchip connection or with an off-chip transceiver. It is compliant with the USB2.0 standard. The USB host module allows communication with USB peripherals with data rates up to 480 Mbps for high-speed, up to 12 Mbps for full-speed, and up to 1.5 Mbps for low-speed.
- One MIPI high-speed synchronous serial interface (HSI) module with two full-duplex serial

1.4 OMAP5430 Package-On-Package Concept

The OMAP5430 die uses flip-chip technology. The OMAP5430 package-on-page (POP) device supports memory stacking using a POP implementation.

The OMAP5430 die provides two LPDDR2 interfaces. Because each interface supports up to two chip-selects (CSs), up to four LPDDR2 memory dies are supported. Those interfaces are available only on device top ball out.

The two stacked memory packages are directly connected to the two LPDDR2 EMIF interfaces of the OMAP5430 die.

Figure 1-3 shows the concept of the POP solution.

Figure 1-3. POP Concept

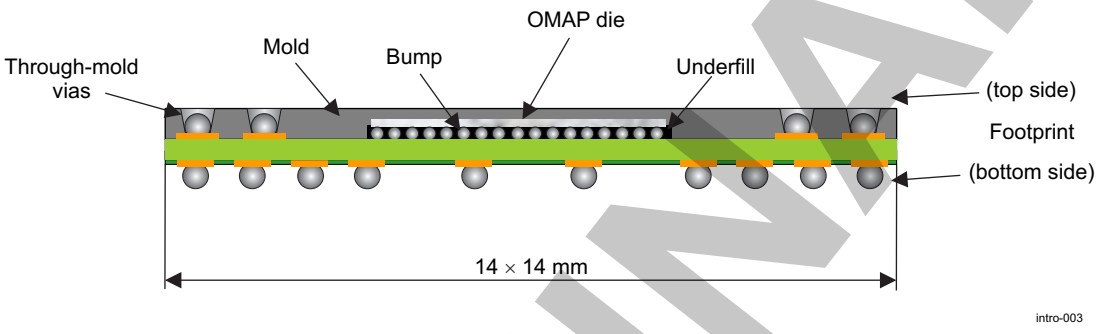

Figure 1-4 shows the stacked memory package on the POP device.

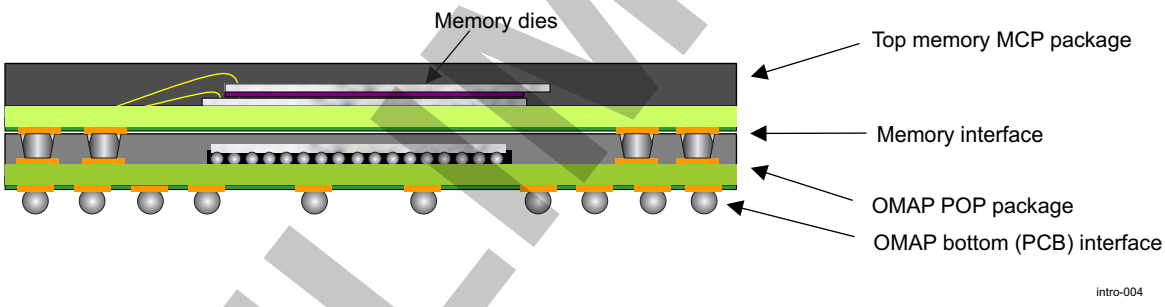
Figure 1-4. Stacked Memory Package on the POP Device



LPDDR2-SDRAM memory is supported in the POP package S4b, with a size of up to 8 GiB and 32-bit data width.

The POP device includes feedthroughs. The feedthroughs are defined from the bottom ball-grid array (BGA) to the stacked memory. The purpose of some of the feedthroughs is to provide power supply to the stacked memories.

1.5 OMAP543x Family and Device Identification

The OMAP543x family is composed of the following devices:

- OMAP5430
- OMAP5432

The OMAP5430 device is offered in a 980-ball, 14 × 14 -mm POP package, which allows LPDDR2 memory stacking. It has all features and functions described in this TRM, except the EMIF DDR3 memory interface.

The OMAP5432 device is offered in a 754-ball, 17 × 17 -mm package, which does not support LPDDR2 memory stacking but instead can interface DDR3 on-board memories. Some of the features and functions described in this TRM are not supported by OMAP5432.

NOTE: See more information about OMAP5432 in Appendix A, OMAP5432 Multimedia Device and the OMAP5432 Data Manual.

Table 1-1 describes the identification registers.

The identification registers include the data registers listed in STD_FUSE_DIE_ID and ID_CODE. These registers are read-only accessed ports that are programmed into eFuses FARM FROM.

2.1 Introduction

The microprocessor unit (MPU) has a 32-bit address port, which allows it to handle a 4-GiB space divided into several regions, depending on the target type.

The memory map has the following features that are shared among the initiators, such as the MPU subsystem and the image and video accelerator (IVA) subsystem:

- Memory space: General-purpose memory controller (GPMC)
- Dynamic memory management (DMM) controller
- Register spaces: Level 3 (L3) and level 4 (L4) interconnects
- Dedicated spaces: IVA/IPU subsystem, etc.

The GPMC and DMM are dedicated to memory connection. The GPMC is used for NOR and NAND flash and static random access memories (SRAMs). The DMM is used for synchronous dynamic random access memories (SDRAMs), such as regular single-data rate (SDR)-SDRAM and mobile double-data rate (DDR)-SDRAM. For more information, see Section 15.2.1, *Dynamic Memory Manager*, and Section 15.3.1, *EMIF Controller*.

The L3 interconnect allows the sharing of resources, such as peripherals and external or on-chip memories, among all the initiators of the platform. The L4 interconnects control access to the peripherals.

Transfers across the platform between initiators and targets are physically conditioned by the chip interconnect and can be logically conditioned by firewalls. For more information about the intercommunication (L3 and L4 interconnects) and protection mechanisms implemented in the device, see Section 14.2.1, *L3 Interconnect*, and Section 14.3.1, *L4 Interconnect*.

Figure 2-1shows the interconnect of the device and the main modules and subsystems in the platform.

2.2 L3_MAIN Memory Space Mapping

The memory space system is hierarchical: level 1 (L1), level 2 (L2), L3_MAIN, and L4. L1 and L2 are memories in the MPU, IPU, and digital signal processor (DSP) subsystems. L3_MAIN handles many types of data transfers, including data exchange with system on-chip/external memories. The chip-level interconnect, which consists of one L3_MAIN and four L4s, enables communication among all modules and subsystems.

This section provides a global view of the memory mapping of the device at the L3_MAIN interconnect and describes the boot, GPMC, and SDRAM controller (SDRC) (EMIF/DMM) spaces.

The system memory mapping is flexible, with two levels of granularity for target address space allocation:

- L1: The four quarters are labeled Q0, Q1, Q2, and Q3. Each quarter corresponds to a 1-GiB address space (the total low-address space is 4 GiB, 32-bit). The CPU extended address range is labeled as high memory (Q8 – Q15) and provides a total of 8 GiB.
- L2: Each quarter is divided into eight blocks of 32 MiB, with target spaces mapped in the blocks.

This organization allows the decoding of all target spaces based on the 7 most-significant bits (MSBs) of the 32-bit address ([31:25]).

- Boot space:

  When booting from the on-chip ROM with the appropriate external sys_boot pin configuration, the lowest 1-MiB memory space [0x0000 0000–0x000F FFFF] is redirected to the on-chip boot ROM address space [0x4000 0000–0x400F FFFF].

  When booting from the GPMC, the memory space is part of the GPMC address space. At reset, the 0x0000 0000 address is available on chip-select 0 (CS0) for a memory size of 16 MiB.

  For more information about the sys_boot pins configuration, see Section 15.4.1, *General-Purpose Memory Controller*, and Section 28.1, *Initialization*.
- GPMC space:

  Eight independent GPMC chip-selects (CS0 to CS7) are available in the first quarter (Q0) of the addressing space to access NOR/NAND flash and SRAM. The chip-selects have a programmable start address and programmable size (up to 128 MiB) in a total memory space of (Q0) 1GiB, but limited now to 512 MiB.
- EMIF1/EMIF2 CS0 space:

  Q2 addressing space is interleaved on two LPDDR-memory controllers (EMIF1 and EMIF2), each activating its CS0 line. These chip-selects can be programmed to 64, 128, 256, 512, 1024, and 2048 MiB. Interleaving occurs at 128-byte granularity.

  The EMIF1-CS0 base address is always 0x8000 0000 at reset, and occupies a 1-GiB address space at reset (interleaving is disabled at reset).
- EMIF1 or EMIF2 CS1 space:

  Q3 addressing space is interleaved on two SDRAM controllers (EMIF1 and EMIF2), each activating its CS1 line. These chip-selects can be programmed to 64, 128, 256, 512, and 1024 MiB. Interleaving occurs at 128-byte granularity.

  EMIF1-CS1 and EMIF2-CS1 are disabled at reset. Their base address is programmable to achieve a continuous address space with the respective CS0, regardless of the address range programmed.

  EMIF1-CS1 is disabled if EMIF1-CS0 memory density is set to 2048 MiB (2 GiB) when interleaving is disabled, or if EMIF1-CS0 plus EMIF2-CS0 memory density is set to 1024 MiB (1 GiB) when interleaving is enabled.
- TILER space:

  Q3 addressing space is also used to access the TILER system. This space is visible only for the imaging subsystem (ISS) and the display subsystem.
- 8 GiB of SDRAM virtualization:

  This is a high address range (Q8 – Q15) that requires an address greater than 32 bits.

Table 2-1 describes the global memory space mapping.

2.3 L4 Memory Space Mapping

Four L4 interconnects handle transfers with peripherals. Each interconnect is in a distinct power domain:

- L4_CFG: CORE power domain
- L4_WKUP: WKUP power domain
- L4_PER: PER power domain
- L4_ABE: ABE power domain

As with the L3_MAIN interconnect, the L4 interconnect can be configured to tune the access according to the characteristics of each module.

The following sections describe the register mapping of the L4 interconnect. Software configures these registers.

2.3.1 L4_CFG Memory Space Mapping

The L4_CFG interconnect is a 16-MiB space composed of the L4_CFG interconnect configuration registers and the module registers.

Table 2-3 describes the mapping of the registers for the L4_CFG interconnect.

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4_CFG interconnect. All other accesses are internal to the L4_CFG interconnect.

Table 2-3. L4_CFG Memory Space Mapping

2.3.4 L4_ABE Memory Space Mapping

The L4_ABE interconnect is a memory space composed of the L4_ABE interconnect configuration registers and the module registers.

ABE modules are dual-mapped inside the MPU/DSP address space:

- Mapped in L3 as the L4 ABE space
- Mapped in MPU and DSP nonshared device map

NOTE: All memory spaces described as modules provide direct access to the module registers outside the L4_ABE interconnect. All other accesses are internal to the L4_ABE interconnect.

Table 2-6 describes the mapping of the registers for the L4_ABE interconnect in the MPU nonshared (private) device address range (L4_ABE).

Table 2-6. ABE MPU Memory Space Mapping

Module Name	Start Address (hex)	End Address (hex)	Size	Description

2.5 DSP Subsystem Memory Space Mapping

The DSP subsystem can access ABE.

ABE has three address spaces:

- ABE NC: This region is for accesses to registers in ABE. For more information about ABE peripheral memory mapping, see Table 2-6.
- ABE: This region is for accesses to memory in ABE. Memory in the ABE subsystem can be cached in DSP L1 and L2. When eDMA tries to access this space, L1/L2 is snooped and if data is present in DSP subsystem caches, data is provided to eDMA from DSP caches. However, if data is not present in DSP caches, the shared cache sends the access to ABE and data returned is not allocated into DSP cache; instead, it is sent to eDMA.
- ABE locked region: This region is similar to the ABE region, except that data from ABE is allocated into Tesla caches and returned to eDMA.

Table 2-10 describes the mapping of the registers of the DSP subsystem.

2.6 Display Subsystem Memory Space Mapping

The display subsystem integrates a display controller (DISPC), a remote frame buffer interface (RFBI), two MIPI® display serial interfaces (DSI1_A and DSI1_C), and a high-definition multimedia interface (HDMI, digital part) link with its PHY.

The DISPC is connected through an interconnect master port to the L3 interconnect and has its own DMAs to fetch the data from the system memory.

2.6.1 L3 Interconnect View of the Display Memory Space

Table 2-11 lists the memory space mapping in the display subsystem from the perspective of the MPU subsystem through the L3 interconnect.

3.1 Device Power Management Introduction

Power management (efficient use of the limited battery resources on a mobile device) is one of the most important design aspects of any mobile system. It imposes strong control over limited available power resources to ensure they function for the longest possible length of time.

The device power-management architecture ensures maximum performance and operation time for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements.

This introduction contains the following information:

- Power-management architecture building blocks for the device
- State-of-the-art power-management techniques supported by the power-management architecture of the device

3.1.1 Device Power-Management Architecture Building Blocks

To provide a versatile architecture that supports multiple power-management techniques, the power-management framework is built with three levels of resource management: clock, power, and voltage.

These management levels are enforced by defining the managed entities or building blocks of the power-management architecture, called the clock, power, and voltage domains.

A domain is a group of modules or subsections of the device that share a common entity (for example, common clock source, common voltage source, or common power switch). The group forming the domain is managed by a policy manager. For example, a clock for a clock domain is managed by a dedicated clock manager within the power, reset, and clock management (PRCM) module. The clock manager considers the joint clocking constraints of all the modules belonging to that clock domain (and, hence, receiving that clock).

NOTE: In the following sections, the term <*module*> is used to represent the device IPs (that is, modules or subsystems), other than the PRCM module, that receive clock, reset, or power signals from the PRCM module.

3.1.1.1 Clock Management

The PRCM module manages the gating (that is, switching off) and enabling of the clocks to the device modules. The clocks are managed based on the requirement constraints of the associated modules. The following sections identify the module clock characteristics, management policy, clock domains, and clock domain management.

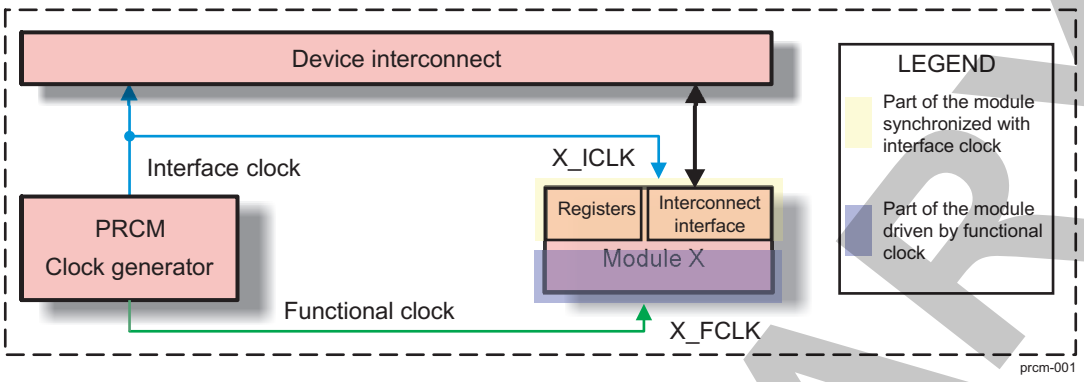
3.1.1.1.1 Module Interface and Functional Clocks

Each module within the device has specific clock input characteristics requirements. Based on the characteristics of the clocks delivered to the modules, the clocks are divided into two categories: interface clocks and functional clocks (see Figure 3-1).

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-1. Functional and Interface Clocks



The interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and the interconnect.
- In most cases, they supply the system interconnect interface and registers of the module.
- A typical module has one interface clock, but modules with multiple interface clocks may also exist (that is, when connected to multiple interconnect buses).
- Interface clock management is done at the device level.
- From the standpoint of the PRCM module, an interface clock is identified with an _ICLK suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or subsystem.
- A module can have one or more functional clocks. Some functional clocks are mandatory, while others are optional. A module needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the module activity (for example, the clock for the camera).
- From the standpoint of the PRCM module, a functional clock is distributed directly to the related modules through a dedicated clock tree. It is identified with an _FCLK suffix.

Some clocks are qualified as permanent clocks. They are functional clocks, that can stay active while the corresponding entity manages them.

NOTE: At the module level, the interface clocks are always fed by the interface clock outputs of the PRCM module. The functional clocks are fed by a PRCM module functional clock output or a PRCM module interface clock output. In the latter case, the functional and interface module clocks inherit the clock-management features (autoidle features) of the PRCM module interface clock.

3.1.1.1.2 Module-Level Clock Management

Each module in the device may also have specific clock requirements. Certain module clocks must be active when operating in specific modes, or they may be gated. Globally, the activation and gating of the module clocks are managed by the PRCM module. Hence, the PRCM module must be aware of when to activate and when to gate the module clocks.

The PRCM module differentiates the clock-management behavior for device modules based on whether the module can initiate transactions on the device interconnect (called master module) or it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based power-management protocols are used:

- Master standby protocol: Clock-management protocol between the PRCM and master modules
- Slave idle protocol: Clock-management protocol between the PRCM and slave modules

Master standby protocol

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

This protocol is used to indicate that a master module must initiate a transaction on the device interconnect and requests specific (functional and interface) clocks for that purpose. The PRCM module ensures that the required clocks are active when the master module requests the PRCM module to enable them. This is called a module wake-up transition and the module is said to be functional after this transition completes.

Similarly, when the master module no longer requires the clocks, it informs the PRCM module, which can then gate the clocks to the module. The master module is then said to be in standby mode.

Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the module. This is done by setting the <*Module*>_SYSCONFIG. MIDLEMODE or <*Module*>_SYSCONFIG. STANDBYMODE bit fields, as described in Table 3-1. The behavior, identified in the STANDBYMODE Bit Value column, must be configured.

Table 3-1. Master Module Standby Mode Settings

STANDBYMODE Bit Value	Selected Mode	Description
0x0	Force-standby	The module unconditionally asserts the standby request to the PRCM module, regardless of its internal operations. The PRCM module may gate the functional and interface clocks to the module. This mode must be used carefully because it does not prevent loss of data at the time the clocks are gated.
0x1	No-standby	The module never asserts the standby request to the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active; however, it is not efficient from a power-saving perspective because it never allows the PRCM module output clocks to be gated.
0x2	Smart-standby	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idled. The PRCM module can then gate the clocks to the module.
0x3	Smart-standby wake-up-capable mode	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idle. The PRCM module can then gate the clocks to the module. The module may generate (master-related) wake-up events when in standby state. The mode is relevant only if the appropriate module mwakeup output is implemented.

NOTE:

- Smart-standby mode is the preferred mode of operation, while force-standby and no-standby modes are intended for debugging purposes.
- A master module may support all or some of the standby modes listed in Table 3-1. See the power-management section in the module chapter to identify the supported standby mode.

The standby status of a master module is indicated by the CM_<*Power domain*>_<*Module*>_CLKCTRL[x]. STBYST bit in the PRCM module. Table 3-2 describes the master module standby status.

Table 3-2. Master Module Standby Status

STBYST Bit Value	Description
0x0	The module is functional.
0x1	The module is in standby mode.

Table 3-3 lists the enabling conditions for the master module clocks managed by the standby protocol.

Table 3-3. Master Module Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Master module standby request is deasserted.

PRELIMINARY

Table 3-3. Master Module Clock Enabling Conditions (continued)

Relation		Condition
		Master module wake-up request is asserted.

Slave idle protocol

This hardware protocol allows the PRCM module to control the state of a slave module. The PRCM module informs the slave module, through assertion of an IDLE request, when its clocks (interface and functional) can be gated. The slave can then acknowledge the request from the PRCM module, and the PRCM module is then allowed to gate the clocks to the module. A slave module is said to be in IDLE state when its clocks are gated by the PRCM module.

Similarly, an idled slave module may need to be woken up because of a service request from a master module or because the slave module receives a wake-up event (for example, an interrupt or a direct memory access [DMA] request). In this situation the PRCM module enables the clocks for the module, and then signals the module to wake up by deasserting the IDLE request.

Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the slave module. This is done by setting the <*Module*>_SYSCONFIG. SIDLEMODE or <*Module*>_SYSCONFIG. IDLEMODE bit field, as described in Table 3-4. The behavior, identified in the IDLEMODE Bit Value column, must be configured by software.

Table 3-4. Module Idle Mode Settings

IDLEMODE Bit Value	Selected Mode	Description
0x0	Force-idle	The module unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully because it does not prevent loss of data at the time the clock is switched off.
0x1	No-idle	The module never acknowledges any IDLE request from the PRCM module. This mode is safe from a module point of view because it ensures the clocks remain active; however, it is not efficient from a power-saving perspective because it does not allow the PRCM module output clock to be shut off, and thus the power domain to be set to a lower power state.
0x2	Smart-idle	The module acknowledges the IDLE request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management.
0x3	Smart-idle wake-up-capable mode	The module acknowledges the IDLE request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management. The module may generate (IRQ- or DMA-request-related) wake-up events when in IDLE state. The mode is relevant only if the appropriate module swakeup output(s) is implemented.

NOTE:

- Smart-idle mode is the preferred mode of operation, while force-idle and no-idle modes are intended for debugging purposes.
- A slave module may support all or some of the idle modes listed in Table 3-4. See the power-management section in the module chapter to identify the supported idle modes.

The idle status of a slave module is indicated by the CM_<*Power domain*>_<*Module*>_CLKCTRL[x] IDLEST bit field in the PRCM module. Table 3-5 lists the possible idle statuses for a slave module.

Table 3-5. Slave Module Idle Status

IDLEST Bit Value	Idle Status	Description
0x0	Functional	The module is fully functional. The interface and functional clocks are active.
0x1	In transition	The module is performing a wake-up or a sleep transition.

Table 3-5. Slave Module Idle Status (continued)

IDLEST Bit Value	Idle Status	Description
0x2	Interface idle	The module interface clock is idled. The module may remain functional if using a separate functional clock.
0x3	Full idle	The module is fully idle. The interface and functional clocks are gated.

When configured in smart-idle mode, the slave module may acknowledge the IDLE request of the PRCM module based on the activity of its interface and/or functional clocks. To define which module clocks (that is, interface and/or functional) should be considered when responding to the PRCM module request, software must configure the <*Module*>_SYSCONFIG[x] CLOCKACTIVITY bit field.

The CLOCKACTIVITY setting is used internally by the module to determine the part of the module on which the conditions to acknowledge the PRCM module IDLE request are tested. As an example, if the functional clock must remain active when the module is in idle mode, the module must acknowledge a PRCM module IDLE request by considering only the interface clock gating conditions (that is, there is no pending activity on the interconnect).

NOTE: See the power-management section in the module chapter to identify whether this feature is configurable.

Using the CLOCKACTIVITY setting along with smart-idle mode ensures that the clock remains active for the module features that must remain available during the module idle mode. Table 3-6 describes the possible CLOCKACTIVITY settings for a module.

Table 3-6. Slave Module Clock Activity Settings

CLOCKACTIVITY Bit Value	Module Interface Clock	Module Functional Clock	Description
0x0	Gated	Gated	The interface and functional clocks are considered when generating the acknowledgment. This setting also means both clocks may be gated upon a PRCM module IDLE request.
0x1	Active	Gated	The interface clock is not shut down and is not considered when generating the acknowledgment to the PRCM module IDLE request. Only the functional clock is considered.
0x2	Gated	Active	The functional clock is not shut down and is not considered when generating the acknowledgment to the PRCM module IDLE request. Only the interface clock is considered.
0x3	Active	Active	The interface and functional clocks are not shut down. The module can acknowledge the IDLE request without checking the internal functions linked to its clocks.

NOTE:

- The software configuration of the CLOCKACTIVITY settings may not be available for a given module. For some modules, the CLOCKACTIVITY settings can be hardwired.
- A slave module may support all or some of the CLOCKACTIVITY settings listed in Table 3-6.

See the power-management section in the specific module chapter to identify the supported idle feature and settings.

CAUTION

The PRCM module does not have any hardware means to read the CLOCKACTIVITY settings of the module. Software must ensure consistent programming between the CLOCKACTIVITY settings of the module and the clock-gating control bits in the PRCM module. The PRCM module must be configured (where software control is available) not to gate the module clock, which should remain active according to the CLOCKACTIVITY settings of the module.

For idle protocol management on the PRCM module side, the behavior of the PRCM module is configured in the CM_<Power domain>_<module>_CLKCTRL[x] MODULEMODE bit field. Based on the configured behavior, the PRCM module asserts the IDLE request to the module unconditionally (that is, immediately when software requests) or through hardware control when the module idle conditions are satisfied. Table 3-7 describes the configurable behavior of MODULEMODE.

Table 3-7. Slave Module Mode Settings in PRCM

MODULEMODE Bit Value	Selected Mode	Description
0x0	Disabled	The PRCM module unconditionally asserts the module IDLE request. This request applies to the gating of the functional and interface clocks to the module. If acknowledged by the module, the PRCM module can gate all clocks to the module (that is, the module is completely disabled). It can react only to an asynchronous wake-up event (that is, a wake-up event that does not require the module functional clock to be active).
0x1	Auto	This mode applies to a module when the PRCM module manages only its interface clock and not its functional clock. The PRCM module automatically asserts/deasserts the module IDLE request based on the clock domain transitions. If acknowledged by the module, the PRCM module can gate the interface clock to the module.
0x2	Enabled	This mode applies to a module when the PRCM module manages its interface and functional clocks. The functional clock to the module remains active unconditionally, while the PRCM module automatically asserts/deasserts the module IDLE request based on the clock domain transitions. If acknowledged by the module, the PRCM module can gate only the interface clock to the module.
0x3	Reserved	Not available

NOTE: The PRCM module may support all or some of the MODULEMODE module settings listed in Table 3-7. See the CM_<Power domain>_<module>_CLKCTRL[x] MODULEMODE bit field description for the module to identify the supported settings.

NOTE: Modules, which can be configured with DISABLED or AUTO values of ModuleMode, cannot go from IDLE to DISABLED state if ModuleMode is changed from AUTO to DISABLED while module is in IDLE state. To Perform this transition domain has to be put in force wakeup (CM_<Clock domain>_CLKSTCTRL[1:0] CLKTRCTRL = SW_WKUP).

Table 3-8 and Table 3-9 list the enabling conditions for the slave module clocks managed by the idle protocol.

Table 3-8. Slave Module Interface Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Slave module idle status is 0x0 (fully functional).
		Slave module idle status is 0x1 (in transition).
		Slave module wake-up request is asserted.

Copyright © 2013, Texas Instruments Incorporated

PRELIMINARY

Table 3-9. Slave Module Functional Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Slave module idle status is 0x0 (fully functional).
		Slave module idle status is 0x1 (in transition).
		Slave module idle status is 0x2 (interface clock is idled).
		Slave module wake-up request is asserted.

The module clock domain must be ready for the optional clocks to the module, and any associated clock-enable control is asserted.

NOTE: A given clock can be used by more that one module. Clock-enabling conditions are then ORed together (that is, the clock is provided as soon as one of the enabling conditions is true). As a consequence, the clock is disabled only when all related enabling conditions are false.

Module wake-up request

In IDLE state, a slave module may have to wake up to generate an interrupt or a DMA request. This can be the result of an external request (for example, to the input/output [I/O] port of a general-purpose input/output [GPIO] module) or an internally generated event (for example, WD_TIMER time up). The slave module, with wake-up capability, sends a wake-up request to the PRCM module. The PRCM module then activates the module clocks and acknowledges the module wake-up request.

In IDLE state, some slave modules may require functional clock(s) to generate a wake-up event. Such requests are called synchronous wake-up events on the PRCM module side, while the events generated when the functional or interface module clocks are gated are called asynchronous wake-up events.

NOTE: See the power-management section in the module chapter to identify whether its wake-up event is synchronous or asynchronous.

The standby and idle clock-management protocols allow the configuration of the module-level clock-management interaction between the PRCM module and individual modules of the device. However, the PRCM module may not necessarily gate the clock to the module immediately after the module switches to standby or idle mode at the end of this interaction. This is because the same clock can be shared by other modules that are active and need this shared clock to complete their activity. As a result, the PRCM module provides a second level of clock management called the clock-domain level, as explained in Section 3.1.1.1.3, *Clock Domain*.

3.1.1.1.3 Clock Domain

A clock domain is a group of modules fed by clock signals controlled by the same clock manager in the PRCM module (see Figure 3-2). By gating the clocks in a clock domain, the clocks to all the modules belonging to that clock domain can be cut to lower their active power consumption (that is, the device is on and the clocks to the modules are dynamically switched to ACTIVE or INACTIVE [gated] state). Thus, a clock domain allows control of the dynamic power consumption of the device.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated clock manager within the PRCM module. This allows the PRCM module to activate and gate individually each device clock domain.

Figure 3-2. Generic Clock Domain

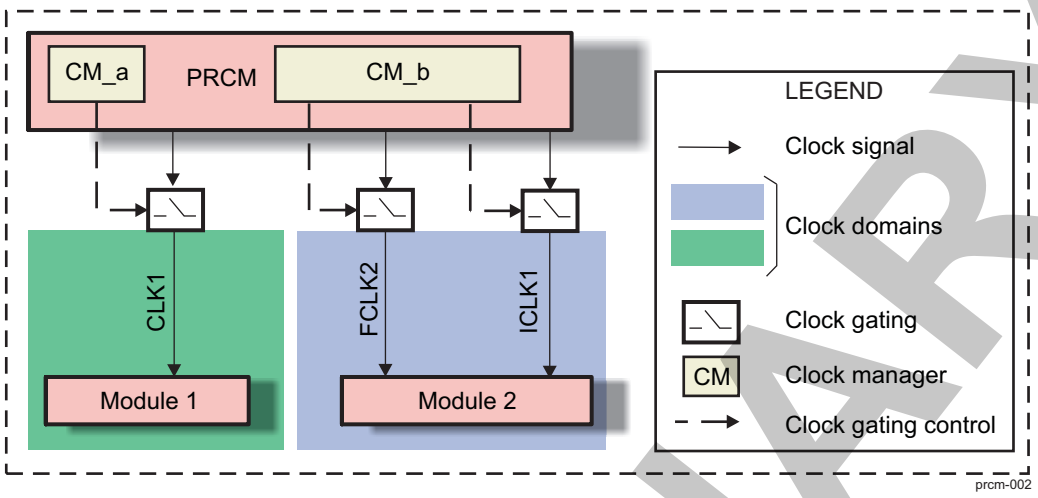

Figure 3-2 is an example of two clock managers: CM_a and CM_b. Each clock manager manages a clock domain. The clock domain of CM_b is composed of two clocks, a functional clock (FCLK2) and an interface clock (ICLK1), while that of CM_a consists of a clock (CLK1) that is used by the module as functional and interface clock. The clocks to Module 2 can be gated independently of the clock to Module 1, thus ensuring power savings when Module 2 is not in use.

The PRCM module lets software check the status of the clock domain functional clocks. The CM_<Clock domain>_CLKSTCTRL[x] CLKACTIVITY_FCLK/<Clock name>_FCLK bit in the PRCM module identifies the state of the functional clock(s) within the clock domain. Table 3-10 lists the two possible states of the functional clock.

Table 3-10. Clock Domain Functional Clock States

CLKACTIVITY Bit Value	Status	Description
0x0	Gated	The functional clock of the clock domain is inactive.
0x1	Active	The functional clock of the clock domain is running.

3.1.1.1.4 Clock Domain-Level Clock Management

The domain clock manager can automatically (that is, based on hardware conditions) and jointly manage the interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

A clock domain can switch between three possible states: ACTIVE, IDLE_TRANSITION (IDLEREQ), and INACTIVE (IDLE). Figure 3-3 shows the sleep and wake-up transitions of the clock domain between ACTIVE and INACTIVE states.

Figure 3-3. Clock Domain State Transitions

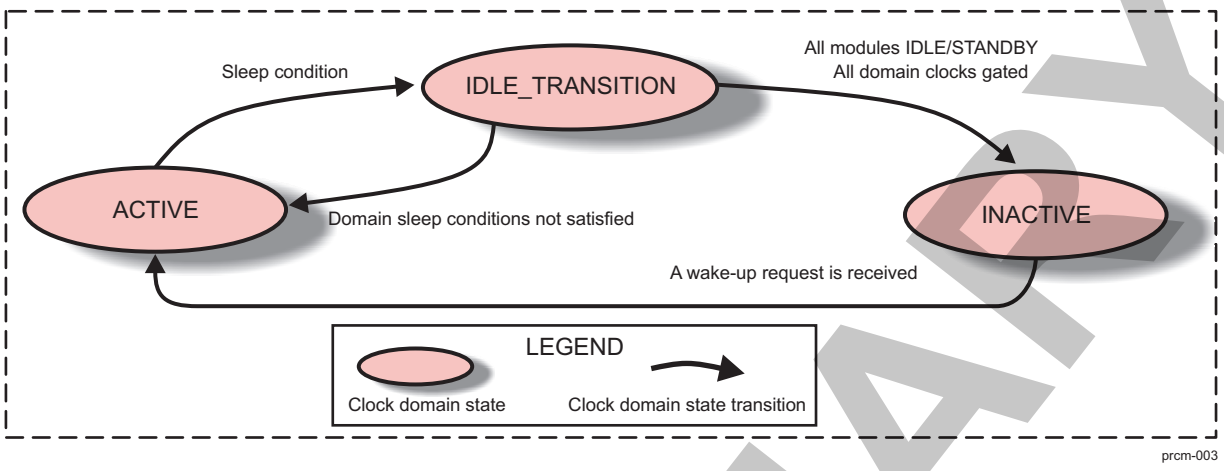

Table 3-11 defines the clock domain states.

Table 3-11. Clock Domain Clock States

State	Description
ACTIVE	• Every nondisabled slave module (that is, those whose MODULEMODE value is not set to disabled) is put out of IDLE state. • All functional clocks to the active slave modules (that is, not idled) of the clock domain are provided. • All interface clocks to the nondisabled slave modules in the clock domain are provided. • All functional and interface clocks to the active master modules (that is, not in STANDBY state) in the clock domain are provided. • Every enabled optional clock to the modules in the clock domain is provided.
IDLE_TRANSITION	This is a transitory state. • Every master module in the clock domain is in STANDBY state. • Every IDLE request to all the slave modules in the clock domain is asserted. • The functional clocks to the slave module in enabled state (that is, those whose MODULEMODE values are set to enabled) remain active. • Every enabled optional clock to the modules in the clock domain is provided.
INACTIVE	All clocks within the clock domain are gated. • Every slave module in the clock domain (that is, those whose MODULEMODE value is set to disabled or auto) is in IDLE state and set to disabled or auto mode. • Every master module in the clock domain is in STANDBY state. • Every optional functional clock in the clock domain is gated.

Each clock domain transition behavior is managed by an associated register bit field in the CM_<Clock domain>_CLKSTCTRL[x] CLKTRCTRL PRCM module.

Table 3-12 describes the clock transition mode settings of the clock domain.

Table 3-12. Clock Domain Clock Transition Mode Settings

CLKTRCTRL Bit Value	Selected Mode	Description
0x0	NO_SLEEP	A clock domain sleep transition is never initiated, regardless of the hardware conditions.
0x1	SW_SLEEP	A software-forced sleep transition. The transition is initiated when the associated hardware conditions are satisfied (see Table 3-14).
0x2	SW_WKUP	A software-forced clock domain wake-up transition is initiated, regardless of the hardware conditions identified in Table 3-13.

Table 3-12. Clock Domain Clock Transition Mode Settings (continued)

CLKTRCTRL Bit Value	Selected Mode	Description
0x3	HW_AUTO	Hardware-controlled automatic sleep and wake-up transition is initiated by the PRCM module when the associated hardware conditions are satisfied (see Table 3-13 and Table 3-14).

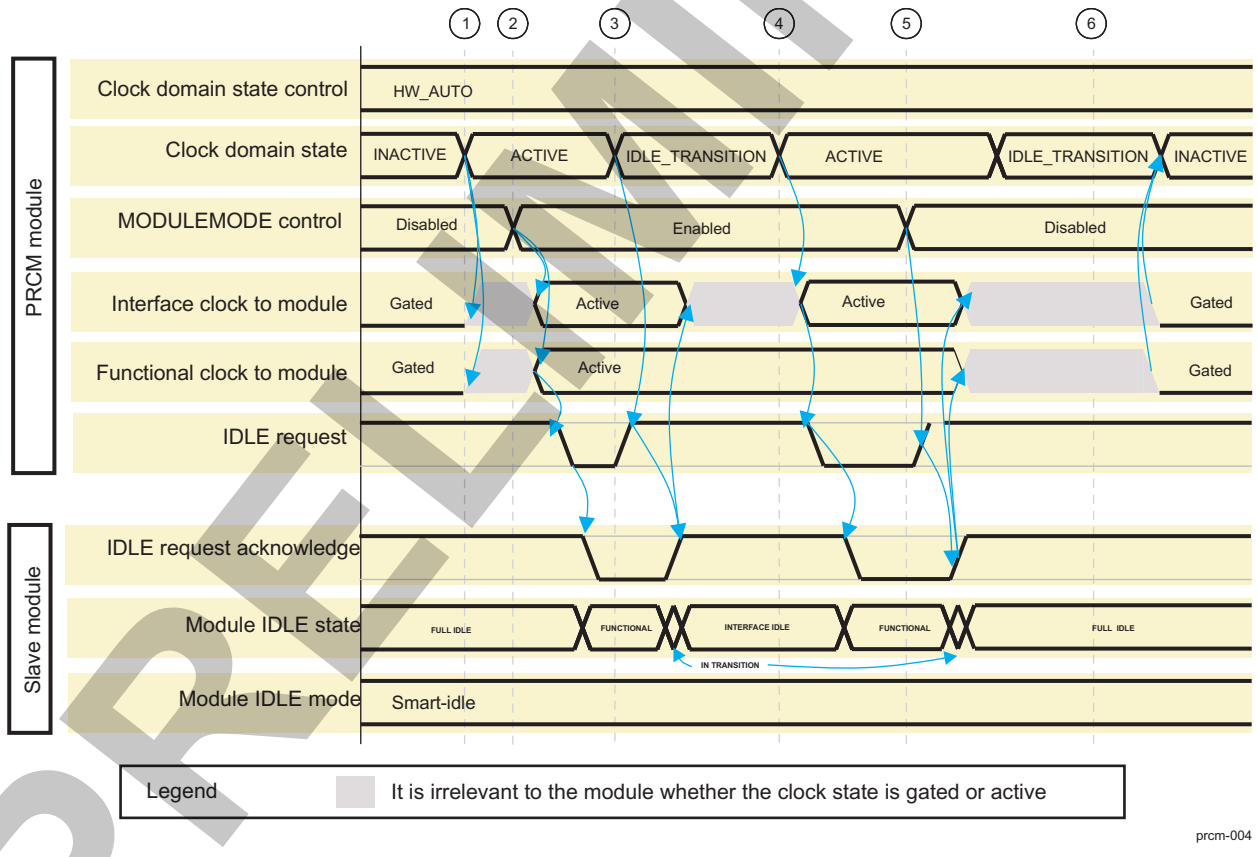
NOTE: Depending on its characteristics, a clock domain may or may not support all the clock transition mode settings described in Table 3-12. See the clock domain clock management section of the specific clock domain to identify the supported clock transition mode settings.

3.1.1.1.5 Clock Domain HW_AUTO Mode Sequences

The sequence diagrams in Figure 3-4 through Figure 3-6 identify the PRCM module hardware-controlled enabling and gating of the functional and interface clocks to the module. They show the changes in the state of the module based on the changes to the clock domain state and module mode settings.

Figure 3-4 shows the behavior of a slave module receiving the interface and functional clocks and having two configurable module modes: disabled and enabled.

Figure 3-4. Clock Domain/Slave Module Clock-Management Interaction Sequence 1



Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes its state to ACTIVE. Because the MODULEMODE control is still disabled, this event has no effect on the state of the module. The functional and interface clocks can still be restarted automatically, based on the requirements of other modules sharing these clocks.

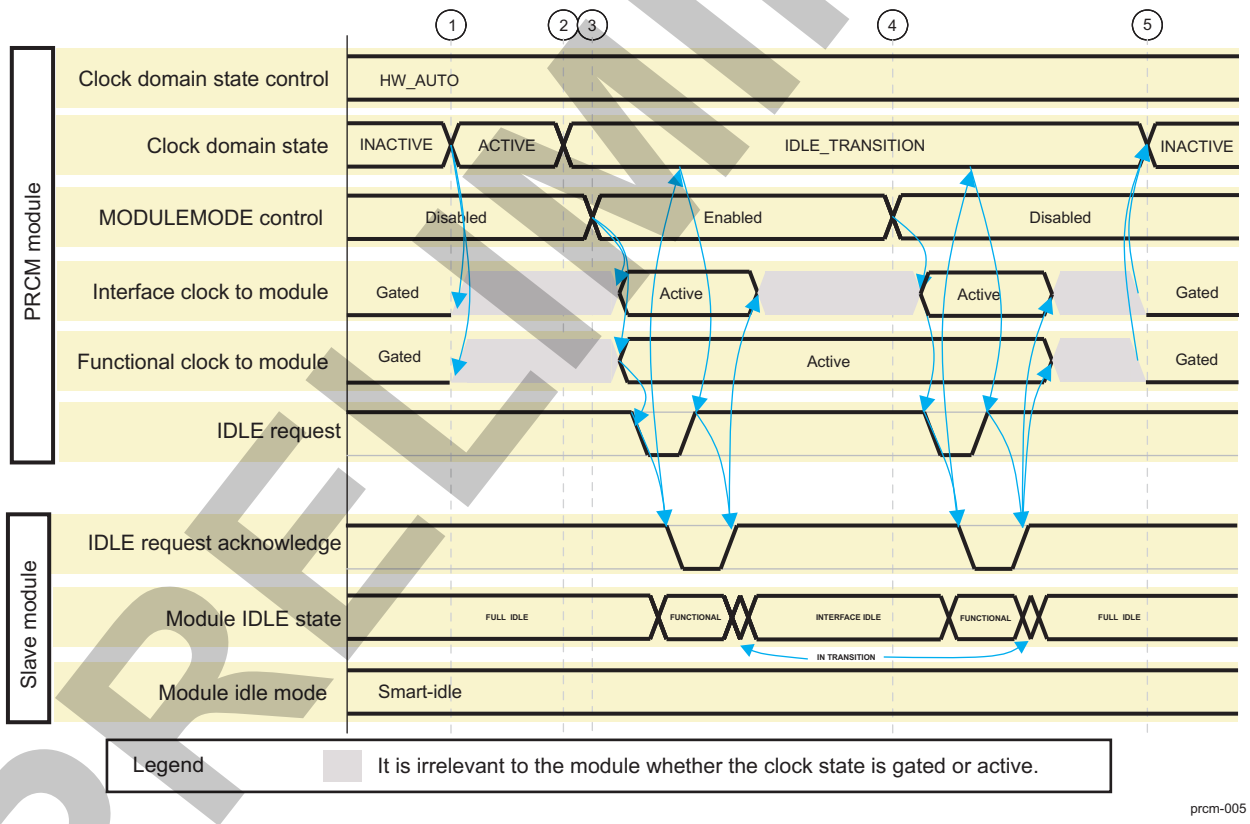
Copyright © 2013, Texas Instruments Incorporated

PRELIMINARY

2. Software changes the module mode to enabled. The clocks to the module are automatically restarted. The PRCM module then deasserts a hardware IDLE request signal to the module. The module sends an IDLE request acknowledge to the PRCM module. The module is now effectively awake. The module IDLE state is functional. If the module is enabled before the clock domain wakes up, Steps 1 and 2 are simultaneous.
3. The clock domain switches to IDLE_TRANSITION state. In turn, the PRCM module requests the module to go into IDLE state by asserting the IDLE request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock. The functional clock of the module remains enabled because the module is in enabled mode.
4. The clock domain does not have all conditions to complete the sleep transition and wakes up again. In turn, the interface clock to the module is automatically restarted, if applicable, and then the module is put out of IDLE state.
5. Software disables the module. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock.
6. The clock domain switches to IDLE_TRANSITION state. When the sleep transition conditions of the clock domain are satisfied, the clocks (functional and interface) are gated. The clock domain then switches to INACTIVE state. This has no effect on the module, which is already in FULL IDLE state.

Figure 3-5 shows the behavior of the same slave module, receiving the interface and functional clocks, when the module mode is changed while the clock domain state is IDLE_TRANSITION.

Figure 3-5. Clock Domain/Slave Module Clock-Management Interaction Sequence 2



Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its functional and interface clocks are gated.

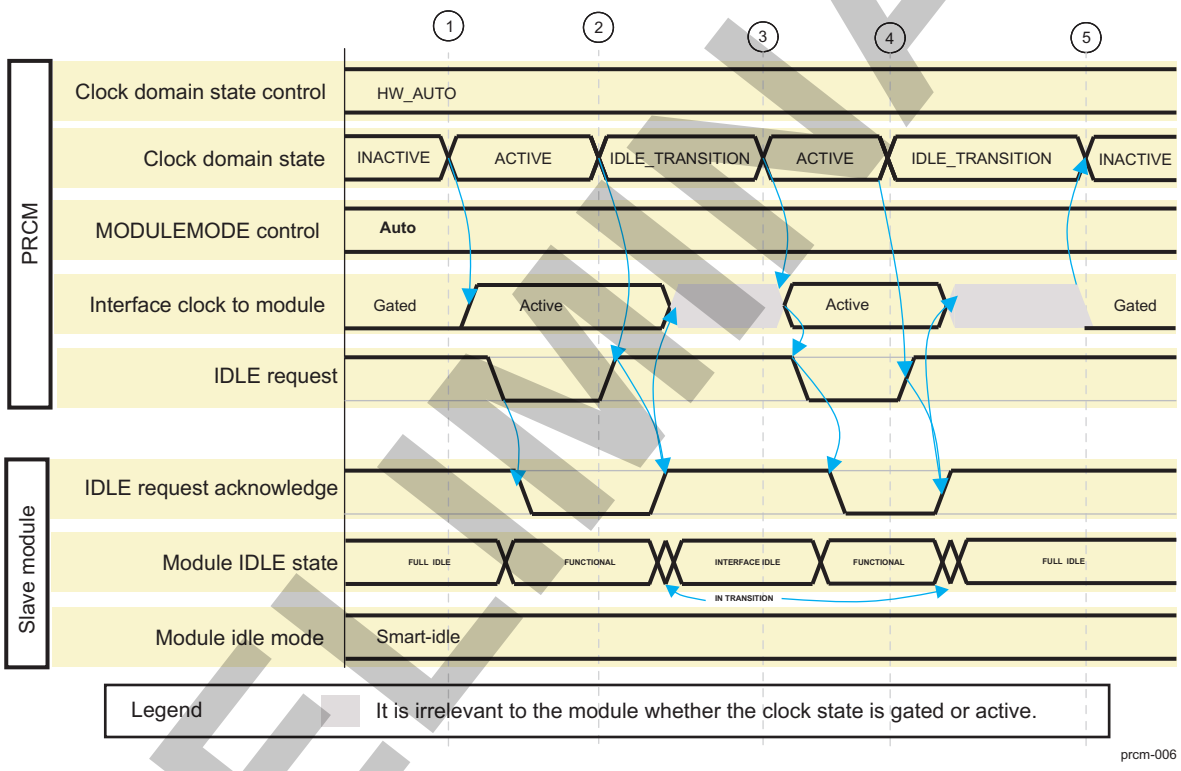
1. The clock domain wakes up and changes its state to ACTIVE. Because the MODULEMODE control is disabled, this event has no effect on the state of the module. The functional and interface clocks can still be restarted automatically, based on the requirements of other modules sharing these clocks.
2. The clock domain goes into the IDLE_TRANSITION state. Because the module mode control is disabled, this event has no effect on the module state.

Copyright © 2013, Texas Instruments Incorporated

3. Software changes the module mode to enabled. The clocks to the module are restarted automatically and then the module is put out of IDLE state. As soon as acknowledged, the module is requested to go back to IDLE state with gating of the interface clock only (that is, the INTERFACE IDLE state). The interface clock to the module can be gated, depending on other modules sharing the same clocks.
4. Software disables the module. The interface clock to the module is restarted automatically. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the interface and the functional clocks to the module can be gated, depending on other modules sharing the same clock.
5. When the clock domain sleep transition conditions are satisfied and the functional and interface clocks are gated, the clock domain switches to INACTIVE state. This has no effect on the module, which is already in FULL IDLE state.

Figure 3-6 shows the behavior of a slave module receiving only interface clock and supporting the configurable auto module mode.

Figure 3-6. Clock Domain/Slave Module Clock-Management Interaction Sequence 3



Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its interface clock is gated.

1. The clock domain wakes up and changes its state to ACTIVE. In turn, the interface clock to the module is automatically restarted. The PRCM module then deasserts a hardware IDLE request signal to the module. The module sends an IDLE request acknowledge to the PRCM module. The module is now effectively awake; that is, the module IDLE state is functional.
2. The clock domain switches to IDLE_TRANSITION state. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the interface clock to the module can be gated, depending on other modules sharing the same clock.
3. The clock domain does not have all conditions to complete the sleep transition and wakes up again. In turn, the interface clock to the module is automatically restarted, if applicable, and then the module goes out of IDLE state.
4. This step is the same as Step 2.
5. The clock domain has all conditions to complete the sleep transition. The module is in IDLE state and its clock is gated.

3.1.1.1.6 Clock Domain Sleep/Wake-up

The clock domain manager initiates a domain wake-up transition when the conditions listed in Table 3-13 are satisfied.

Table 3-13. Clock Domain Wake-Up Conditions

Relation	Condition
OR	The SW_WKUP clock transition mode for the clock domain is set (CLKTRCTRL = 0x2).
	At least one wake-up request is asserted by one of the modules of the clock domain.
	At least one dynamic dependency(1) from another clock domain is active.
	At least one static dependency(1) from another clock domain is active.
	At least one wake-up dependency(1) from a module in another clock domain is active.

(1) The dynamic, static, and wake-up dependencies are explained in Section 3.1.1.1.7, *Clock Domain Dependency*.

The clock domain manager initiates a domain sleep transition when the conditions listed in Table 3-14 are satisfied.

Table 3-14. Clock Domain Sleep Conditions

Relation		Condition
AND		All master modules in the clock domain are in STANDBY state.
		No wake-up request is asserted by any module of the clock domain.
		No dynamic domain dependency(1) from any other domain is active.
		No wake-up dependency(1) from any module in another domain is active.
		No static domain dependency(1) from any other domain is active.
	OR	The SW_SLEEP clock transition mode is set for the clock domain (CLKTRCTRL = 0x1).
		The HW_AUTO clock transition mode is set for the clock domain (CLKTRCTRL = 0x3).

(1) The dynamic, static, and wake-up dependencies are explained in Section 3.1.1.1.7, *Clock Domain Dependency*.

3.1.1.1.7 Clock Domain Dependency

A domain dependency is a binary relationship between two clock domains. A clock domain A is said to depend on a clock domain B when a module in clock domain B provides services to a module in clock domain A. As a result, clock domain B must be active when clock domain A is active so that the module in clock domain B is accessible by the module in clock domain A.

Dependency between two clock domains can also exist if one clock domain serves to ensure communication between two modules (for example, the clock domain of the device interconnect).

Thus, a clock domain can support the types of clock domain dependencies described in the following sections.

Table 3-15 and Table 3-16 detail all the domain dependencies:

- **NA/NA**: if no dependency can exist because no corresponding interconnect path exists in the device
- When cell is different than NA/NA, the cell contains two attributes:
  - First attribute for the presence and control method of a static dependency:
    - **SW**: Static dependency is controlled by a software bit. This is the most generic way of control. Depending on the use case and on latency requirement for accessing target domain, software can enable or not the static dependency. When not enabled, access to those domains is performed using dynamic dependencies.
    - **1**: Static dependency is always enabled (hard-wired). This is relevant for a domain that has an "exact standby" system initiator with the target domain being the domain containing the interconnect module to which the initiator is connected.
    - **0**: Static dependency is never enabled (hard-wired). This is relevant for domains that do not have strong access latency requirements, or for which a static dependency is not desired for

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

specific reasons (for example, dependencies with emulation domain). Access to those domains is performed using dynamic dependencies.

- **NA**: Nonapplicable (means domain has no system initiator able to access the other domain)

– Second attribute for the presence and control method of a dynamic dependency:

- **1..n**: Dynamic dependency is always enabled (hard-wired). The number of corresponding interconnect interfaces is also specified. This is relevant for most of the domain-to-domain direct interconnect connection.
- **0**: Dynamic dependency is never enabled (hard-wired). This is relevant only when a static dependency is always enabled between same domains, or when the target domain cannot support the wakeup on access feature.
- **NA**: Nonapplicable (means that both domains are not directly linked by an OCP interface)

When a static dependency is hardware-coded between two domains directly linked by one or several interconnect interfaces, then the corresponding dynamic dependency is useless.

Emulation domain (DAP initiator) has no static dependency with any other domain. It has, however, a dynamic dependency with the L3_MAIN2 interconnect. A domain that can access an emulation domain does not have static or dynamic dependency with it.

Domain dependencies are chosen such that any access (even from EMU/DAP) towards a nondisabled target is always completed normally. Using static dependencies allows having minimal access latencies by keeping necessary domains on whenever the initiator is not standby. This may be at the expense of additional power consumption because some domains may stay on while not in use for a long time. By disabling static dependencies, applicative access is still completed normally by waking up, if applicable, the necessary domain on the path from the initiator to the target. Power consumption can be optimized at the expense of additional access latencies.

NOTE: It is required to put destination domain into forced wakeup (CLKTRCTRL = SW_WKUP) before changing a configurable static dependency.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

3.1.1.1.7.1 Static Dependency

If clock domain A has a master module that can access a slave module in clock domain B, then clock domain A can have a static dependency with clock domain B. Similarly, a static dependency can also exist between domain A and B if domain B conveys the transactions from a domain A module toward a module in any other domain. For example, CD_DSP can have a static dependency with CD_L3_MAIN1 because this domain has a level 3 (L3) interconnect to carry the transactions from the digital signal processor (DSP) module.

This static dependency consists of forcing clock domain B to stay active as long as there is at least one master module of clock domain A that is not in STANDBY state. If clock domains A and B are initially in GATED state, then clock domain B becomes active as soon as clock domain A becomes active when a wake-up request from the master module is received by the PRCM module.

Similarly, as a result of the static dependency, clock domain B can be gated only if all the master modules of clock domain A that can access the slave modules in clock domain B are in STANDBY state.

The static dependency between a source clock domain and a destination clock domain is configured in the PRCM module by setting the CM_<Source Clock domain>_STATICDEP[x] <Destination Clock domain>_STATDEP bit. As a result, the source clock domain forces the destination clock domain to become active and stay active as long as the source clock domain is active.

The destination domain must be put into forced wake-up (CM_<X>_CLKSTCTRL[1:0] CLKTRCTRL = SW_WKUP) before changing a configurable static dependency.

3.1.1.1.7.2 Dynamic Dependency

When clock domains A and B contain modules directly linked to a common device interconnect, these clock domains can have a dynamic dependency.

A dynamic dependency consists of forcing clock domain B to stay active as long as a module from clock domain A is communicating with the module in clock domain B through the interconnect. Clock domain B becomes active as soon as the communication is initiated. This is automatically managed by the PRCM module by monitoring the communication on the interconnect between the modules of the two clock domains.

Similarly, the inverse condition of this dependency can be stated: Clock domain B can be inactive only if all modules between clock domains A and B are quiet for a given sampling delay, identified as a sliding window duration on the interconnect activity status.

The size of the sliding window is based on the number of cycles of a prescaled level 4 (L4) clock whose frequency is configured by setting the CM_DYN_DEP_PRESCAL[5:0] PRESCAL bit field. The prescaled clock frequency is given as:

Prescaled clock frequency = L4 interface clock frequency / (PRESCAL + 1)

The size of the sliding window is fixed by setting the CM_<Clock domain>_DYNAMICDEP[27:24] WINDOWSIZE bit field. It is given as:

Sliding window duration = WINDOWSIZE × Period of Prescaled clock cycle

Figure 3-7 is an example of the sliding window duration equal to eight clock cycles of an L4 clock when PRESCAL is set to 3 and WINDOWSIZE is set to 2.

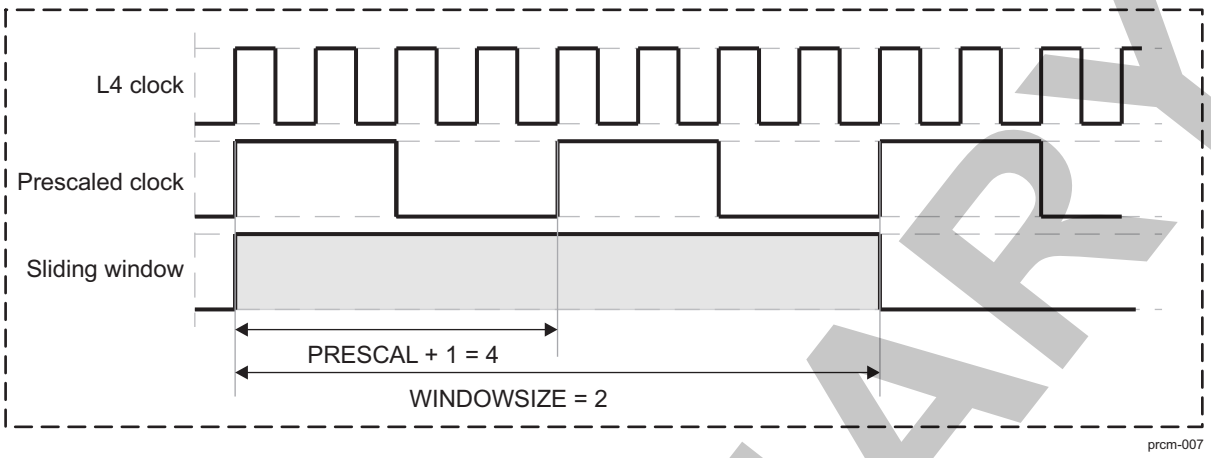
Figure 3-7. Sliding Window for Dynamic Dependency



This dynamic dependency is also referred to as the autosleep/autowakeup feature.

NOTE:

- The static dependency between two clock domains can be configured by software (PRCM module registers) or hardwired in the PRCM module.
- The dynamic dependency between two clock domains is hardwired in the PRCM module.

A dynamic dependency is said to be active when both of the following conditions are met:

- At least one master module or a slave interconnect module from clock domain A to domain B is active (that is, the master module is not in STANDBY state and/or the interconnect slave module is not in IDLE state)
- There has been one or more transaction on the interconnect within the sliding window duration.

Otherwise, a dynamic dependency is said to be inactive.

The dynamic dependency between a source clock domain and a destination clock domain can be read in the PRCM module from the corresponding read-only CM_<Source Clock domain>_DYNAMICDEP[x] <Destination Clock domain>_DYNDEP bit.

NOTE: It is recommended to use dynamic dependencies. They give better power results. Static dependencies should be rarely used (in some cases they can be used as they give shorter latency for a system initiator to access slave).

3.1.1.1.7.3 Wake-Up Dependency

A wake-up dependency is a dependency between the clock domain of a module that owns one or several wake-up signals toward the clock domain of another module needed to service the associated wake-up event. As a result of this dependency, the wake-up event to a module activates not only its clock domain but also the clock domain of the servicing module.

NOTE: To ensure that the clock domain of the servicing module remains active, the wake-up signal that triggers a wake-up dependency stays active as long as the source of the event is not serviced.

Wake-up dependencies allow acceleration of the wake-up transition of multiple domains needed to service the wake-up event by initiating their transition in parallel. The static and dynamic dependencies can allow the wake-up of related domains, but the complete wake-up transition of all the associated domains is slower because of the sequential cascading of their wake-up transitions.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

In the device, the source event of the wake-up signal to a slave module can be either of following types:

- Interrupt request to the microprocessor unit (MPU), DSP, or image processor unit (IPU) interrupt controller (INTC)
- DMA request to a DMA controller

Upon wake-up by these types of wake-up events, and for as long as they remain asserted, the PRCM module takes the following actions:

- The power domain of the servicing module (for example, MPU, DSP, IPU, or DMA) is forced to POWER ON state and the clock domain becomes active.
- The power domain of the device interconnect between the servicing module and the module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The power domain of the slave module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The slave module originator of the wake-up event is switched from IDLE to ACTIVE state.

On assertion of a wake-up event of a stand-alone master module, and as long as it remains asserted, the PRCM module takes the following action:

- The power domain of the master module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.

NOTE: For slave modules, the static and dynamic dependencies of a clock domain are not affected by its wake-up dependency settings. For master modules, the static dependencies are not affected.

Hence, in addition to the activation of the clock domains previously described, all clock domains associated by static dependencies are also activated.

However, the clock domains associated with the wake-up clock domain through dynamic dependencies are activated only if a transaction is initiated to these clock domains.

For each wake-up signal coming from a slave module, the type of the corresponding event can be configured in the PM_<Power domain>_<Originator Module> _WKDEP[x] WKUPDEP_<Originator Module>_<Servicing Module> bit of the PRCM module, where <Power domain> is the name of the power domain of the originator module of the wake-up event identified as <Originator Module>. Servicing Module refers to the module servicing the wake-up event.

NOTE: When only one event type is associated with the wake-up signal of a slave module, the wake-up dependency (WKUPDEP) for the module clock domain is not configurable and may be hardwired in the PRCM module.

For the master modules, there is no configurable wake-up dependency. Their power domain is switched on and their clock domain is activated by the PRCM module when they assert their wake-up signal.

3.1.1.2 Power Management

The PRCM module manages the switching on and off of the power supply to the device modules. To minimize device power consumption, the power to the modules can be switched off when they are not in use. Independent power control of sections of the device lets the PRCM module turn on and off specific sections of the device without affecting other sections.

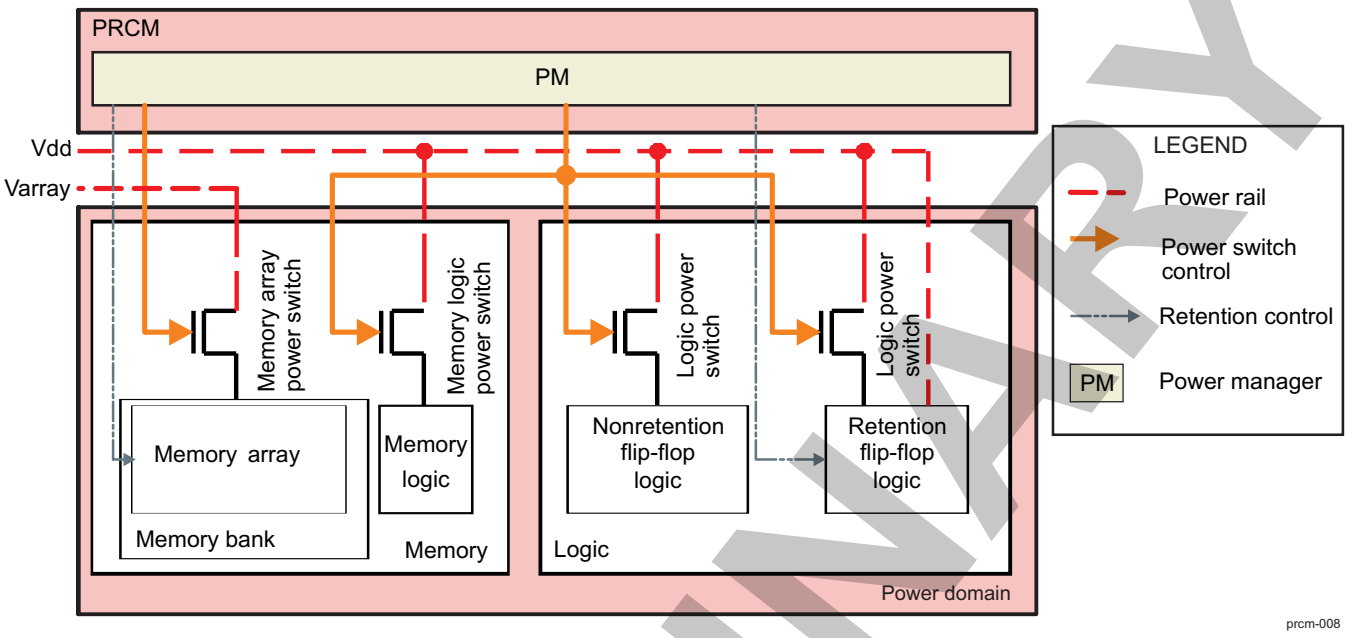
3.1.1.2.1 Power Domain

A power domain is a section (that is, a group of modules) of the device with an independent and dedicated power manager (see Figure 3-8). A power domain can be turned on and off without affecting other parts of the device.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-8. Generic Power Domain



To minimize device power consumption, the modules are grouped into power domains. A power domain can be split into logic and memory areas.

The memory area contains two entities:

- Memory bank: Composed of memory arrays. It is powered by a dedicated voltage rail and an associated power switch (for example, Varray and memory array power switches).
- Memory logic: Powered by the same voltage source as the logic area of the power domain, but has its dedicated power switch (for example, Vdd and memory logic power switches)

The logic area in the power domain can also be split between retention flip-flops (RFFs) and nonretention flip-flops (DFFs).

Table 3-17 lists the possible states and substates of the logic area in a power domain.

Table 3-17. States of a Logic Area in a Power Domain

State	Substate	Description
ON	ON-ACTIVE	Logic is fully powered and at least one enclosed clock domain is active.
	ON-INACTIVE	Logic is fully powered and all enclosed clock domains are idled.
RETENTION	CSWR (close switch retention)	Logic is fully powered and all enclosed clock domains are idled.

The RETENTION state is useful for quickly switching to low-power idle mode (in which the domain clocks are gated and the domain voltage is less than the on-voltage level) without losing the context, and then quickly switching back to ON-ACTIVE state when necessary. In RETENTION state, power consumption is less than in ON power state.

Similarly, in RETENTION state the CSWR state has faster turn-on times and higher leakage currents.

The behavior of the memory array power switch and memory logic power switch can be selected through software settings in the PRCM module or can be hardwired. Once the behavior is selected, the PRCM module hardware automatically handles these elements to ensure correct power transition sequencing between the power domain states.

Software can also initiate power state changes of the memory array when the associated power domain is in ON power state. This allows the memory array to be turned off and on as needed.

The memory area can be configured to any of the power states listed in Table 3-18.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Table 3-18. States of a Memory Area in a Power Domain

State	Description
ON	The memory array is powered and fully functional.
RETENTION	The memory array is fully powered, but memory is not accessible. The array can be put into retention through an applicable direct retention control signal. Data in memory are always retained.

3.1.1.2.2 Module Logic and Memory Context

In case of a power state transition in the logic or memory areas, the context of the module may no longer be valid. This can also be the case when the domain resets are asserted by the device. A specific RM_<Clock Domain Name>_<Module Name>_CONTEXT register provides the status of the device logic and memory context.

- The module logic context consists of simple flip-flops (DFFs) if the module has no logic RFFs.
- If the module has logic retention (full or partial), it is assumed that the context consists only of RFFs.

NOTE: The display subsystem is an exception where the status of DFF and RFF context is given, because only HMDI keys are retained, while most of the display subsystem is not retained.

These context status bits must be cleared by software.

3.1.1.2.3 Power Domain Management

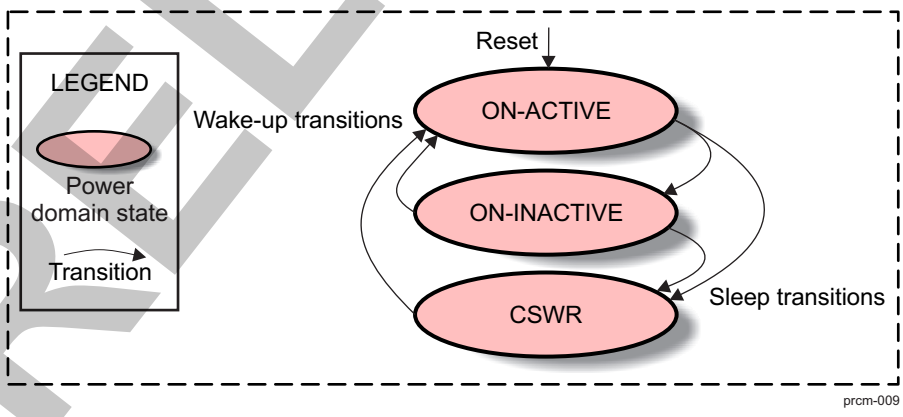
The power manager associated with each power domain is assigned the task of managing the domain power transitions. It ensures that all hardware conditions are satisfied before it can initiate a power domain transition from a source to a target power state (for example, from ON-ACTIVE state to CSWR RETENTION state).

The hardware condition for power domain transition from ON-ACTIVE to any other transition state is:

- All clock domain managers in the power domain are in ON-INACTIVE state: All modules in the domain are in IDLE or STANDBY state, and there is no constraining dependency (static, dynamic, or wake-up dependency) between the clock domains blocking the clock domain sleep transition.

Figure 3-9 shows all possible power domain state transitions.

Figure 3-9. Power Domain Transitions



Successive power-down transitions can be performed by lowering the power state from ON-ACTIVE to ON-INACTIVE, and then to RETENTION, as long as the hardware condition is satisfied.

However, the power domain wake-up transition from any low-power state (ON-INACTIVE or CSWR) to ON-ACTIVE state is always direct. For example, user software cannot request a power domain transition from the ON-INACTIVE state to the CSWR state, but only to the ON-ACTIVE state.

The power domain manager initiates a power domain wake-up transition when the conditions listed in Table 3-19 are satisfied.

PRELIMINARY

Table 3-19. Power Domain Wake-Up Conditions

Relation		Condition
AND		Voltage domain is on.
	OR	There is at least a wake-up condition for one enclosed functional clock domain.
		There is a request for clock generation or distribution enclosed in the power domain.
		There is a PRCM module service request (applicable only to power domains, including PRCM module logic).

The power domain manager initiates a domain sleep transition when the conditions listed in Table 3-20 are satisfied.

Table 3-20. Power Domain Sleep Conditions

Relation	Condition
AND	All functional clock domains enclosed in the power domain are idled.
	All clock generation or distribution enclosed in the power domain is quiet, and corresponding input clocks are gated. For example, DPLL, if present, must be in stop mode.
	There is no PRCM module service request (applicable only to power domains, including PRCM module logic).

Table 3-21 lists the control and status features of the PRCM module power domain.

Table 3-21. Power Domain Control and Status Registers

Register/Bit Field	Type	Description
PM_<Power domain>_PWRSTCTRL[1:0] POWERSTATE	Control	Selects the target power state of the power domain among ON-ACTIVE, ON-INACTIVE, and RETENTION
PM_<Power domain>_PWRSTCTRL[x] LOWPOWERSTATECHANGE	Control	Power state change request when domain has already performed a sleep transition. Allows going into deeper low-power state without waking up the power domain.
PM_<Power domain>_PWRSTCTRL[2] LOGICRETSTATE	Control	Selects whether the power domain logic is in CSWR RETENTION state when the domain transitions to RETENTION state
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_RETSTATE	Control	Selects whether the memory bank in the power domain is in ON or RETENTION state when the power domain is in RETENTION state. The memory bank cannot be in ON state when the power domain is in RETENTION state.
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_ONSTATE	Control	Selects whether the memory bank is in the ON or the RETENTION state when the power domain is in the ON state
PM_<Power domain>_PWRSTST[1:0] POWERSTATEST	Status	Identifies the current state of the power domain. It can be RETENTION, ON-INACTIVE, or ON-ACTIVE.
PM_<Power domain>_PWRSTST[2] LOGICSTATEST	Status	Identifies the current state of the logic area in the power domain.
PM_<Power domain>_PWRSTST[20] INTRANSITION	Status	Identifies whether a power state transition in the power domain is in progress or there is no ongoing transition
PM_<Power domain>_PWRSTST[x] <memory bank>_STATEST	Status	Identifies the current power state of the memory bank in the power domain. It can be RETENTION or ON.
PM_<Power domain>_PWRSTST[25:24] LASTPOWERSTATEENTERED	Status	Identifies the last (previous) power state of the power domain. It can be RETENTION, ON-INACTIVE, or ON-ACTIVE.

3.1.1.3 Voltage Management

The PRCM module controls the voltage scaling (that is, switching the voltage in discrete steps or in a continuum within a range of possible values) of the power sources of the device. This allows control of the power consumption of the device according to the defined performance criteria. Higher performance is ensured with higher voltage and clock frequencies (and hence higher power consumption), while lower performance can be supported with lowered power consumption by reducing or completely gating the power supply to specific areas of the device and gating the associated clocks.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

3.1.1.3.1 Voltage Domain

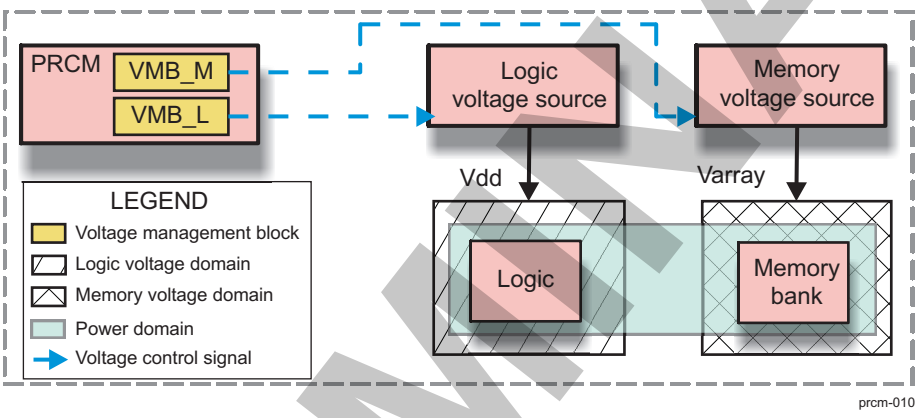
A voltage domain is a section of the device supplied by a dedicated voltage source (that is, an internal LDO or external switch mode power supply [SMPS]). A voltage domain may or may not be controlled by the PRCM module. When a voltage domain is controlled by the PRCM module, a dedicated voltage manager is associated. The voltage manager allows regulation of the voltage level of the source for the voltage domain independently of other voltage domains of the device.

The voltage managers in the PRCM module can be of two types:

- Dynamically configurable by software to scale the domain voltage level to specific values within the operational voltage range of the device. This is called adaptive voltage scaling (AVS).
- Hardware-controlled to automatically switch the domain voltage levels according to the associated hardware conditions.

Figure 3-10 shows a voltage domain.

Figure 3-10. Generic Voltage Domain



By partitioning the device into independent voltage domains, different operating voltages can be assigned to the different sections of the device (that is, a group of modules or memory banks). The independent voltage control allows voltage scaling of device subsections to ensure that each module or memory bank operates at the optimized operating voltage level based on the application performance requirements. When all modules within a voltage domain are idle (that is, have no ongoing transaction), the domain voltage can be lowered to reduce power consumption and then switched back to normal operating voltage level when a wake-up event is received by one of the modules of the voltage domain. Similarly, when a memory bank is not in use, it can be switched to retentionvoltage levels to ensure power savings.

Table 3-22 describes the different states of the logic voltage domain.

Table 3-22. States of Logic Voltage Domain

State	Description
ON	The voltage regulator source for the voltage domain is active and operating in its normal voltage range for the current operating performance point (OPP) and can deliver up to the maximum load current defined for the current OPP.
SLEEP	The voltage regulator source is operating in its normal voltage range, but it can deliver only a limited load current (no logic activity on this voltage domain). In sleep mode, regulator power consumption is reduced.
RETENTION	The voltage regulator source is operating at retention voltage level. It delivers the minimal load current required to maintain the voltage domain logic context.

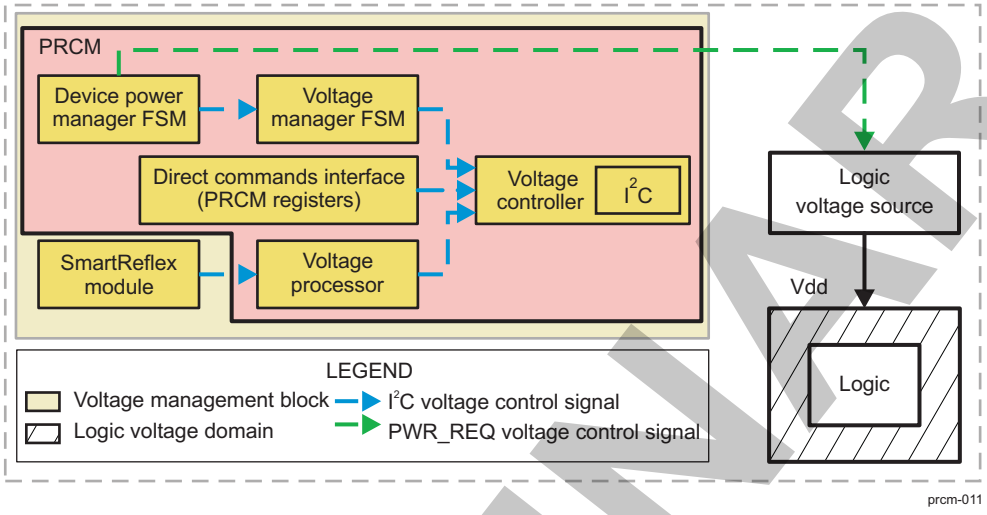
3.1.1.3.2 Voltage Domain Management

Figure 3-11 shows the different voltage control paths available within a generic logic voltage management block to control the voltage supply to the logic voltage domains of the device.

Figure 3-11. Generic Logic Voltage Management



3.1.1.3.2.1 Logic Voltage PWR_REQ Voltage Control

A PWR_REQ signal is deasserted when the device needs to change its current power state to other. The external power integrated circuit (IC) can be used to properly manage turn-off or turn-on of the logic voltage source.

3.1.1.3.2.2 Logic Voltage I^2C Voltage Control

The PRCM module allows three voltage control paths to a dedicated inter-integrated circuit (I^2C™) interface for the logic voltage domains it manages:

1. The hardware-managed voltage of the PRCM module changes from device power manager voltage finite state-machine (FSM) through a voltage manager FSM based on hardware conditions. It sends the voltage commands when the device enters the RETENTION state and upon device wakeup.
2. Direct control by user software through the PRCM module registers for voltage scaling
3. AVS (see Section 3.1.1.3.3, *AVS Overview*) with SmartReflex™ voltage control commands through the voltage processor

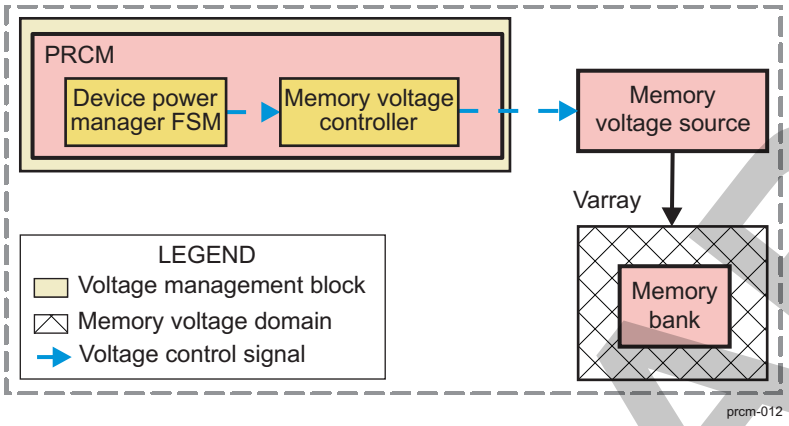
NOTE: An I^2C host module (not controlled by the PRCM module) can be used to program the external power IC. Because this procedure completely bypasses the PRCM module, see Section 23.1, *I^2C*.

Figure 3-12 shows the voltage control path available within a generic memory voltage management block to control the voltage supply to the memory voltage domains of the device.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-12. Generic Memory Voltage Management



The PRCM hardware supports automatic scaling down of the memory array supply whenever the memory domains transition to the RETENTION power state. The device power manager FSM manages the voltage scaling of memory voltage domains through the memory voltage controller (or LDO).

3.1.1.3.3 AVS Overview

SmartReflex is a power-management technique used to control the operating voltage of a device to reduce its active power consumption.

With SmartReflex, the power supply voltage is adapted to the silicon performance in two ways:

- Statically adapted to the manufacturing process of a given device
- Dynamically adapted to the temperature-induced current performance of the device

SmartReflex achieves optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variations.

The static correction of the device voltage level (see Figure 3-13) is based on the desired performance level and silicon performance characteristics of the device. As a result of process dispersion, each die has its specific silicon performance. The range of the process distribution defines the weak devices (low-performance silicon) and the strong devices (high-performance silicon).

A weak device is a device with the lowest performance tolerated for a process distribution; that is, at the typical voltage, the inherent maximum frequency is the lowest frequency of the chip distribution. Considered as the worst case, weak devices are used to constrain the target frequency of all the chips (OPP definition).

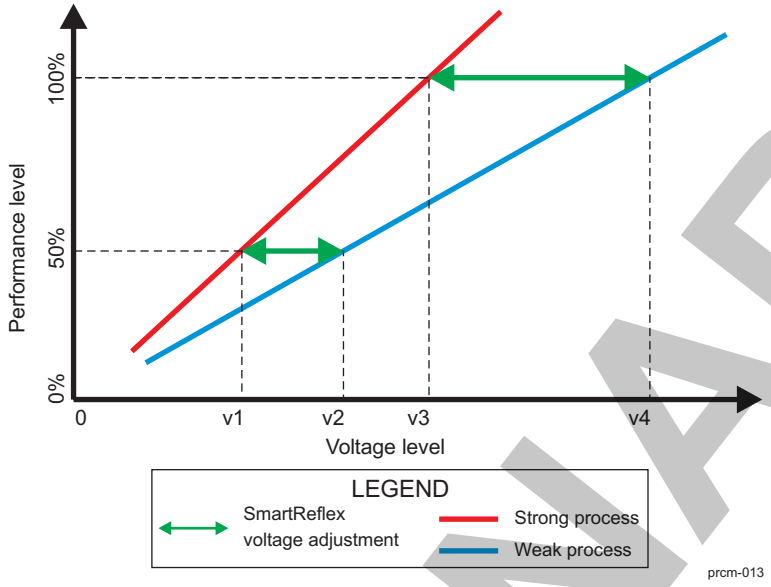
A strong device is a device with the highest performance tolerated for a process distribution. The inherent maximum frequency at the typical voltage is greater than the targeted frequency.

Figure 3-13 shows that with the SmartReflex voltage-control architecture, it is possible to compensate for the device silicon characteristics and obtain optimal performance characteristics. Based on the device characteristics, the device voltage level can be adjusted for specific performance level.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-13. SmartReflex Static Voltage Adjustment

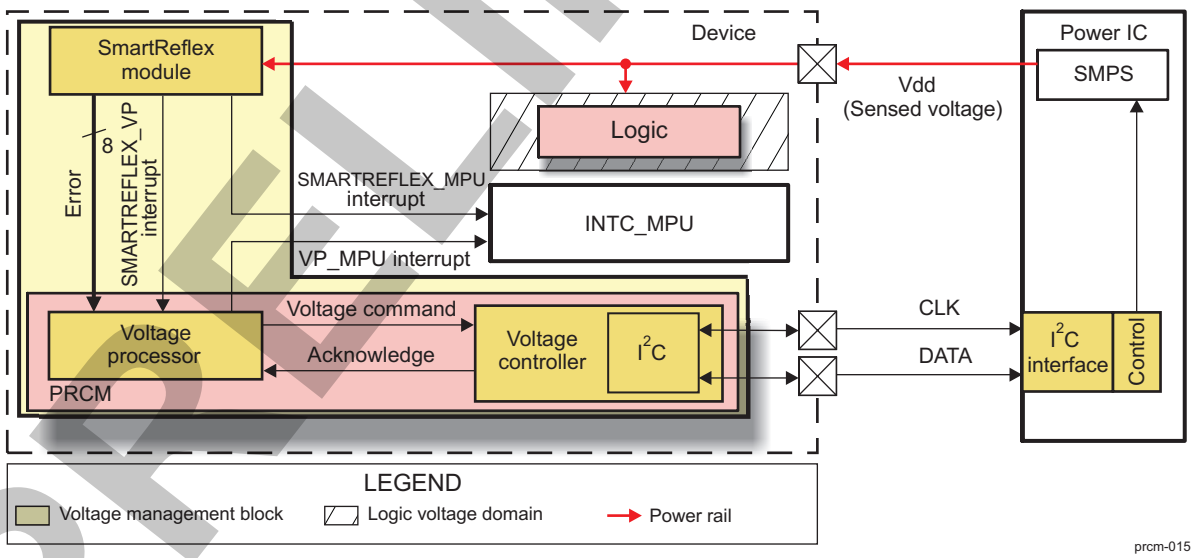


The dynamic correction of the device voltage is based on the real-time comparison of predefined performance points to the on-chip measured performance level. The device voltage level is raised or lowered to compensate for temperature-induced performance variations.

Without SmartReflex, the voltage variation is near the nominal voltage level and is not controlled through any active dynamic compensation. This leads to power waste.

Figure 3-14 is a functional overview of the SmartReflex voltage-control architecture of the device connected to an external power IC.

Figure 3-14. SmartReflex Voltage Control Functional Overview



SmartReflex voltage control consists of the following modules:

- SmartReflex
- INTC_MPU
- Voltage processor
- Voltage controller
- I^2C interface

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

- SMPS

The SmartReflex module senses input voltage (Vdd) and generates an error value that identifies the difference between the desired optimal voltage and the actual value of the SMPS. This error value is set in an internal register (for software read, if necessary) and is also passed to the voltage processor.

The voltage processor converts the error value to a voltage command that defines the change in the output voltage of the SMPS required to bring it to the desired voltage level.

The voltage command is sent to the voltage controller, which passes it to the power IC through the dedicated I^2C interface. The power IC then adjusts the output voltage of the SMPS according to the command.

In this way, the SmartReflex module dynamically adjusts the SMPS voltage to compensate for voltage variations.

The device supports Class 1.5 for SmartReflex voltage control or software-controlled hardware calibration mechanism.

3.1.1.3.3.1 Class 1.5 SmartReflex Voltage Control

SmartReflex Class 1.5 is a software controlled hardware calibration mechanism designed to improve DVFS latencies and system performance. When SmartReflex modules are used in class 1.5, the Voltage Processors should be disabled. Here the calibration is only at boot time.

In SmartReflex Class 1.5, the calibration procedure is triggered by the user software (for example once per day or week) to account for device aging. Additional temperature margins are fused, thus no user software is involved.

3.1.2 Power-Management Techniques

The following sections describe the power-management techniques supported by the device.

NOTE: The values in Figure 3-15 through Figure 3-17, which show the power-management techniques, are hypothetical. They do not represent valid test results on the device.

3.1.2.1 Standby Leakage Management

Standby leakage management (SLM) is a power-management technique that reduces standby power consumption by reducing power leakage.

With SLM, the device switches into low-power system modes automatically or in response to user requests during system standby (that is, in situations when no application is started and system activity is negligible or limited).

When applying SLM, the system remains in the lowest static power mode compatible with the system response time requirement.

This technique trades static power consumption for wake-up latency.

3.1.2.2 Dynamic Voltage and Frequency Scaling

Dynamic voltage and frequency scaling (DVFS) consists of minimizing the idle time of the system. The DVFS technique uses dynamic selection of the optimal operating frequency and voltage to allow a task to be performed in the required length of time. This reduces the active power consumption (power consumed while executing a task) of the device while still meeting task requirements.

NOTE: The values in Figure 3-15 are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-15. Comparison of Energy Consumed With/Without DVFS

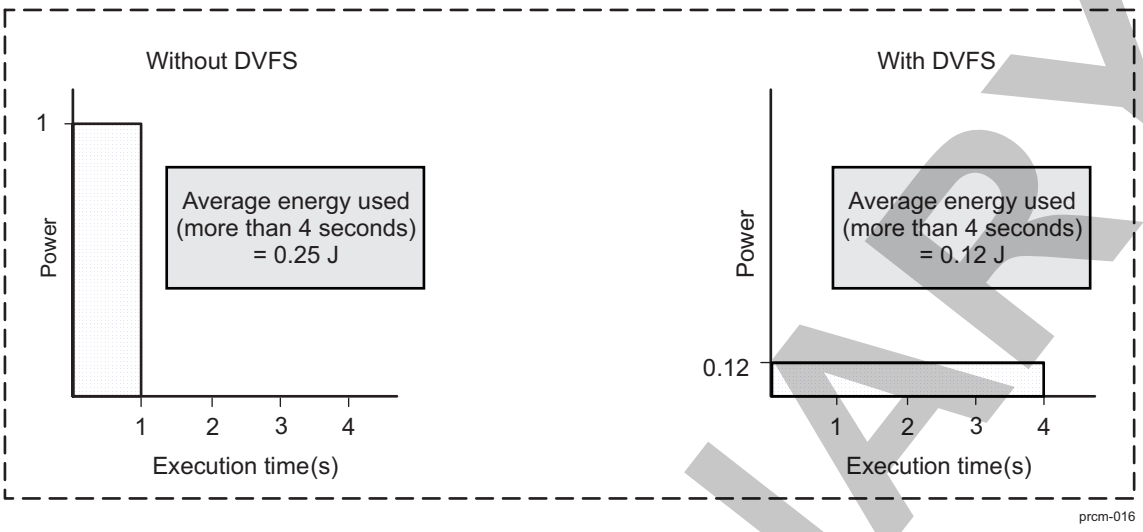


Figure 3-15 shows the DVFS technique by comparing a process executed at maximum frequency and operating voltage without applying DVFS to the same process executed at optimal frequency and voltage using DVFS, based on the task requirements. If a task that must terminate in 4 seconds is performed at maximum operating frequency (see the left side of the figure), it terminates in 1 second, and the remaining 3 seconds are spent in idle mode.

With DVFS (see the right side of the figure), the operating frequency is reduced to optimal level; the task takes the full 4 seconds to complete, but power consumption is reduced. In addition, the voltage can be reduced further to save power so the dynamic and leakage power consumption are reduced.

DVFS requires control over the clock frequency and the operating voltage of the device elements. By intelligently switching the individual elements of the device to their OPPs, the power consumption of the device for a given task can be minimized.

For practical reasons related to the development of the device (flow, tools), DVFS can be used only for a few discrete steps, not over a continuum of voltage and frequency values. Each step, or OPP, is composed of a voltage (V) and frequency (F) pair. For an OPP, the frequency corresponds to the maximum frequency allowed at a voltage, or reciprocally; the voltage corresponds to the minimum voltage allowed for a frequency.

When applying DVFS, a processor or system always runs at the lowest OPP that meets the performance requirement at a given time. The user determines the optimal OPP for a given task and then switches to that OPP to save power.

3.1.2.3 Dynamic Power Switching

Like DVFS, dynamic power switching (DPS) is a power-management technique intended to reduce the active power consumption of a device. However, whereas DVFS reduces dynamic and leakage power consumption, DPS reduces only leakage power consumption, at the expense of a slight overhead in dynamic power consumption.

With DPS, the system switches dynamically between high- and low-consumption system power modes during system active time. When DPS is applied, a processor or system runs at the highest OPP (maximum frequency and voltage) to complete its tasks quickly, followed by an automatic switch to a low-power mode for minimum power consumption. DPS is useful when a real-time application is waiting for an event. The system can switch into a low-power system mode if the wake-up latency conditions allow it.

This technique consists of maximizing the idle period of the system to reduce its power consumption.

NOTE: The values in Figure 3-16 are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-16. Comparison of Energy Consumed With/Without DPS

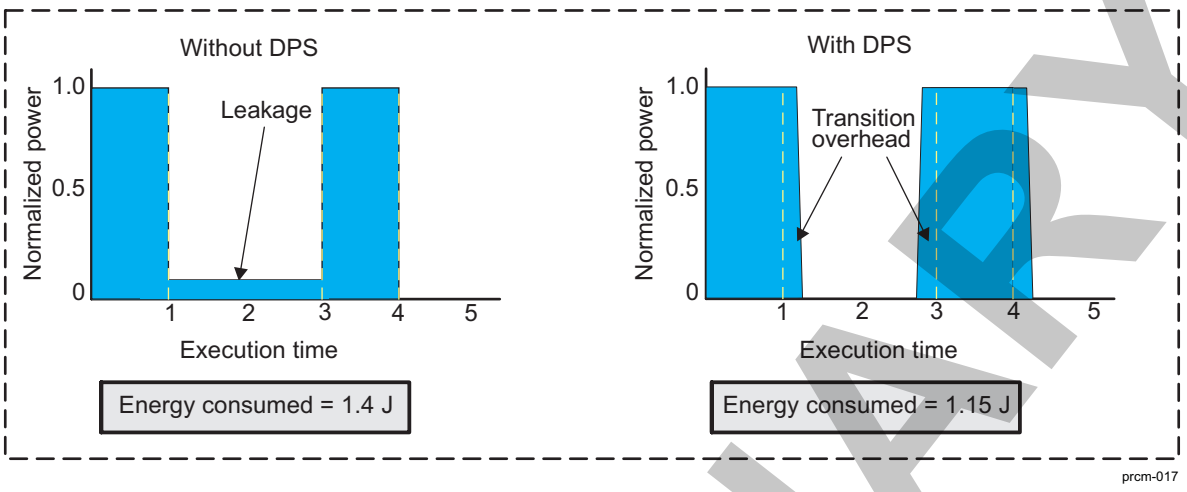

Figure 3-16 compares the behavior of power consumption for the same operation of the device without DPS (see the left side of the figure) and with DPS (see the right side of the figure). When operating without DPS, the device has a constant leakage current in idle mode. By using DPS, the system reduces the leakage current to 0. However, the transitions between system power modes may require storing the information before entering a low-power inactive state and restoring the information after a wake-up event (see Figure 3-16). This results in additional dynamic power consumption, referred to as transition overhead (see Figure 3-16). Transition overhead must be considered for a DPS operation.

For efficient deployment of DPS techniques, it is necessary to predict dynamically the performance requirement of the applications running on the processor. The DPS controller must account for the overhead of wake-up latencies related to domain switching and ensure that they do not significantly affect the performance of the device. Even with transition overhead, the user can identify an optimal idle-time limit, after which the DPS is useful for dynamic power saving.

3.1.2.4 Adaptive Voltage Scaling

SmartReflex-based AVS is a power-management technique for automatic control of the operating voltages of the device to reduce active power consumption.

With SmartReflex, power-supply voltage is adapted to silicon performance, either statically (based on performance points predefined in the manufacturing process of a given device) or dynamically (based on the temperature-induced real-time performance of the device). A comparison of these predefined performance points to the real-time on-chip measured performance determines whether to raise or lower the power supply voltage.

AVS achieves the optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variation. The device voltage is automatically adapted to maintain performance of the device. This ensures optimal power consumption for a given OPP.

With AVS, the frequency steps are identified and the voltage is adapted according to the silicon performance of the device. In this case, instead of a voltage step for each frequency step, there is a corresponding range of voltages. The range depends on the fabrication process of the device and its real-time operating state (temperature) at a given frequency.

3.1.2.5 Adaptive Body Bias

The device implements transistor body bias techniques for forward body bias (FBB) to boost the operating clock frequency for operation at higher OPPs.

Adaptive body bias (ABB) is based on the process corner and the current OPP. This is configured in the EFUSE_CTRL_CUST bit field at the device characterization and is not continuously updated. A dedicated LDO (VBBLDO) is used to produce the voltage bias.

ABB is supported only for MPU and MM domains.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

3.1.2.6 SR3-APG (Automatic Power Gating)

In addition to power-management techniques supported in the device, the MPU subsystem also employs SR3-APG power-management technology to reduce leakage. This technology allows for full logic and memory retention on MPU_C0 and MPU_C1 when required conditions are satisfied. It is controlled by the PRCM_MPU. For more information, see Chapter 4, *Dual Cortex-A15 MPU Subsystem*.

3.1.2.7 Combining Power-Management Techniques

The power-management techniques previously described have specific features and are most effective when used under the specific operating conditions of the device. Hence, the best active power savings are obtained by combining the DVFS, DPS, SLM, and AVS techniques. For a given operating state, one or more of the power-saving techniques can be applied to ensure optimal operation with maximum power saving.

AVS can be used at boot time to adapt the voltage to the process characteristics (strong/weak) of the device and then be used continuously to compensate temperature variations. AVS can also ensure the maximum available application performance of the device at a given OPP.

When medium application performance is required, or when application performance requirements vary, DVFS can be applied. The voltage and frequency can be scaled to match the closest OPP that meets the performance requirement.

When application performance requirements fall between two OPPs, or when a low application performance is required that is below the lowest performance OPP, DPS can be applied to switch to low-power mode.

When combining DVFS and DPS, the operating frequency must not be scaled to match the performance requirement without scaling the voltage. Lower operating frequency increases task completion time and reduces idle time. This prevents DPS or reduces its efficiency (DPS becomes more effective as idle time increases). Unless DPS cannot be applied for other reasons, for a given operating point of DVFS the operating frequency must always be set to the maximum allowed at a given voltage. This ensures optimal process completion time and application of DPS.

If DPS cannot be applied in a given context, scaling the frequency while keeping the voltage constant does not save energy; it does, however, reduce peak power consumption. This can have a positive effect on temperature dissipation and battery life.

SLM must be used when no applications are running and performance requirement drops to 0.

NOTE: The OPPs shown in Figure 3-17 are only for indication and clarity of text. They do not correspond to validated OPPs of the device.

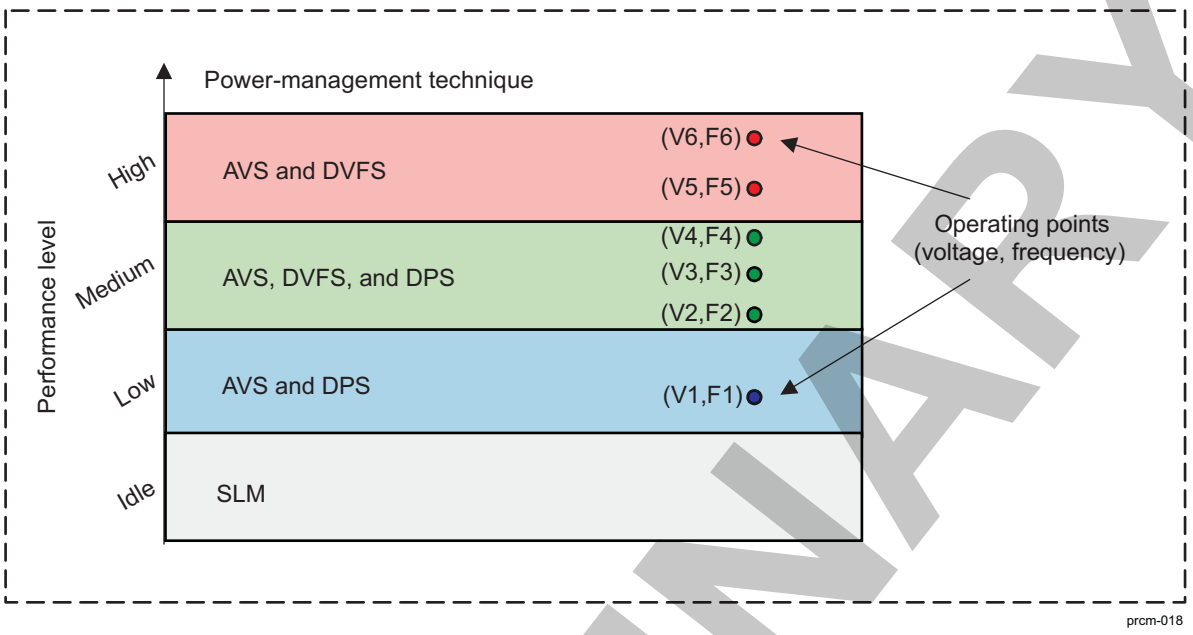
Figure 3-17. Performance Level and Applied Power-Management Techniques



3.1.2.7.1 DPS Versus SLM

DPS and SLM are similar concepts: they consist of switching the system between high- and low-power consumption modes. However, their operating timescales differ, principally in the latency allowed for mode transitions.

DPS is generally used in an applicative context (tasks are started). Therefore, mode transitions are related to system performance requirements or the processor load. DPS transition latencies must be small (typically between 10 µs and 100 µs) compared to the time constraints or deadlines of the application so that they do not degrade application performance. DPS requires performance prediction to ensure that transition latencies do not deteriorate device performance to the point that real-time application deadlines are missed or the user experience degrades too much for an interactive application.

SLM is not used in an applicative context (no task started). Mode transitions are related more to system responsiveness, and the transition latencies must be small compared to user sensitivity so that they do not degrade the user experience. For SLM, transition latencies are typically 1–10 ms or more.

DPS and SLM also differ in the type of wake-up event used to exit low-power idle mode. For DPS, wake-up events are application-related (timer, DMA request, peripheral interrupt, etc.); for SLM, wake-up events are user-related (touch screen, key pressed, peripheral connections, etc.).

3.2 PRCM Subsystem Overview

3.2.1 Introduction

The power-management framework of the device significantly reduces dynamic power consumption and static leakage current to extend the life of the battery in the end product. This framework incorporates support for state-of-the-art power-management techniques. It ensures optimal device operation with significantly reduced power consumption. The power-management framework (PMFW) of the device is split over the following modules:

- SCRM: Handles system-level (with one or more devices) clock and reset distribution and management
- PRCM: A logical module composed of the following three physical submodules:
  - PRM: Handles device-level power and reset management. It also handles some clocks in the device. This module always remains on, unless no power is supplied to the device pads.
  - CM_CORE_AON: Handles device-level clock management of the MPU, DSP, and ABE power domains. This module always remains on, unless no power is supplied to the device pads.
  - CM_CORE: Handles device-level clock management of the IVA, CORE, COREAON, display subsystem (DSS), CAM, GPU, L3INIT, and L4_PER domains. This module does not always remain on. It is switched to full retention mode when its power domain (PD_CORE) is in RETENTION state. It is off when no power is supplied to the device pads.
- SMARTREFLEX_MPU, SMARTREFLEX_MM, and SMARTREFLEX_CORE (SmartReflex): Handle AVS features

Together, these modules provide enhanced power-management features with centralized control for the clock, reset, and power-management signals in the device.

The device supports the power-management techniques with the following features:

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows any combination of domain ON/OFF states
- Clock tree with selective clock-gating conditions
- Hardware-controlled reset sequencing management
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of the power domains
- Support for hardware-controlled autogating of module clocks
- Memory retention capability for preserving memory contents in low-power sleep mode
- DVFS support for the processor and peripherals
- AVS support for the processor and peripherals, for real-time performance adjustments
- Support for I/O pad configuration in low-power device mode for minimum power consumption when in a low-power power state

The PMFW interfaces with all the components of the device for power, clock, and reset management through associated control signals. It integrates enhanced features to let the device adapt energy consumption dynamically according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

The power-management modules are fully configurable through their L4 interface ports.

Figure 3-18 is an overview of the power-management modules and their internal connections with a generic power domain.

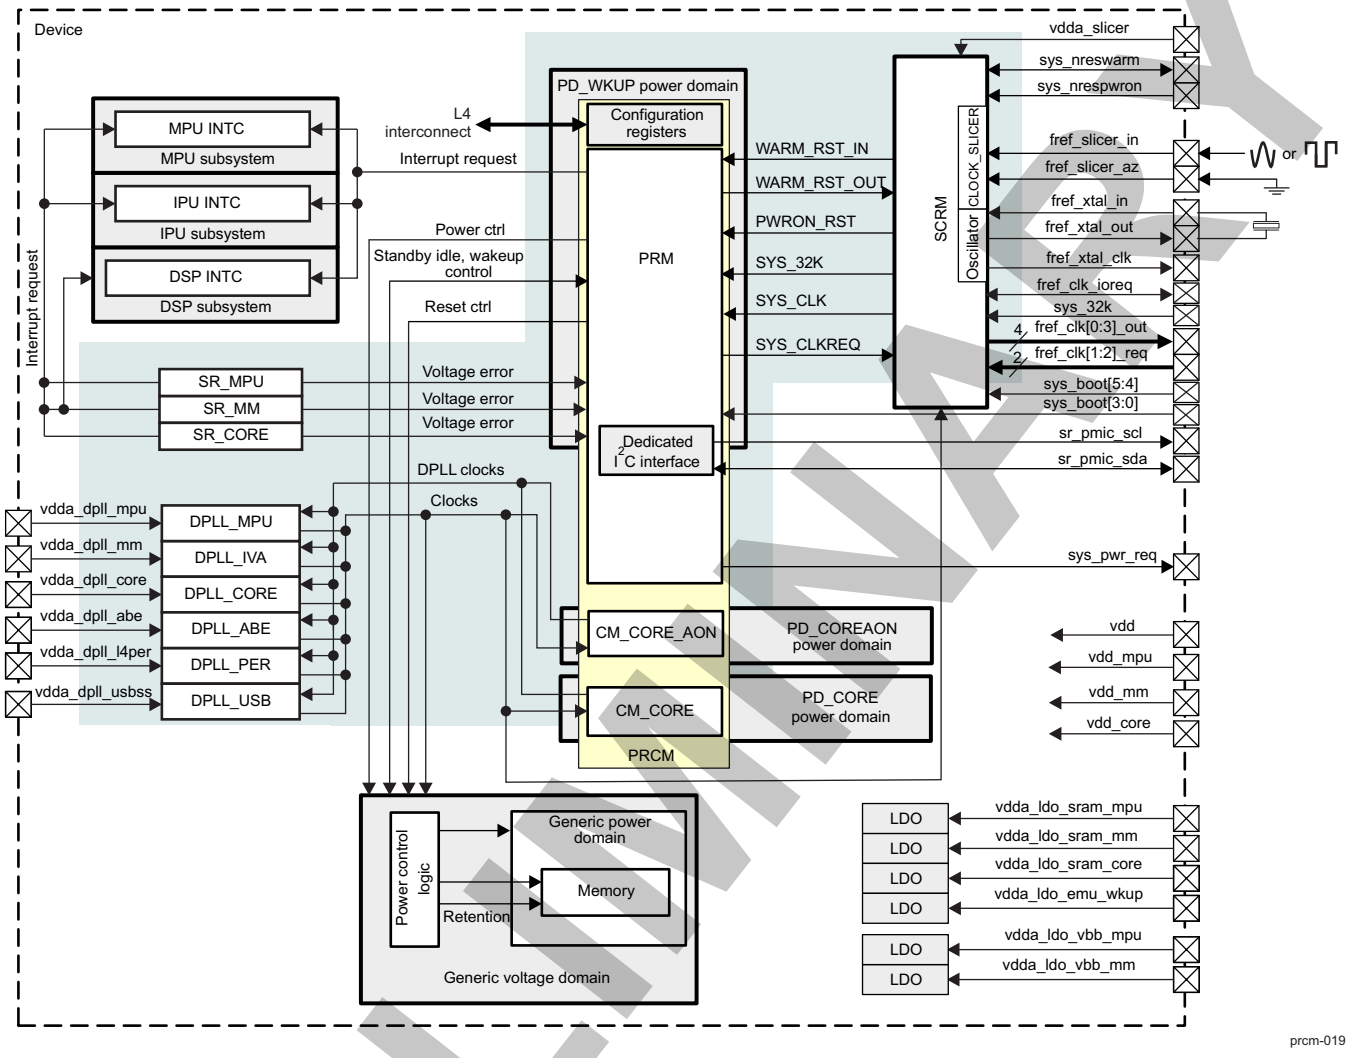
Figure 3-18. PMFW Overview



NOTE: The device I/O logic maps the module signals to the different pads of the device. For more information, see the *Common Pad Configuration Controls* and *I/O Cell Specific Pad Group Controls* sections in Section 18.4.8, *Control Module*.

3.2.2 Power-Management Framework Features

The power-management modules:

- Manage independent power domains
- Control scalable logic voltage domains and selectable voltage modes for memory voltage domains
- Handle standby, idle, and wake-up procedures for the modules of the device
- Allow software and partial hardware control
- Monitor and handle wake-up events
- Control system clock and reset input sources
- Manage and distribute clocks and resets with high control granularity
- Handle power-up sequences
- Have debug and emulation features
- Allow adaptive and dynamic voltage scaling with dedicated high-speed (HS) master I^2C interface

3.3 PRCM Subsystem Environment

The modules of the PMFW receive the external reset, clock, and power signals. See Figure 3-18.

NOTE: In the remainder of this chapter, power IC refers to a peripheral power source IC that is interfaced with the device. It receives power control commands (voltage scaling and power switching) from the device and provides the necessary voltages and reset signals.

The following sections describe the interfaces for external clock, reset, and power sources.

3.3.1 External Clock Signals

The SCRM module receives a low-frequency clock input, sys_32k, at 32,768-Hz frequency, which will be referenced as a 32-kHz clock. The SCRM module can receive a high-frequency system clock through two possible inputs: fref_slicer_in or fref_xtal_in. The fref_slicer_in input supplies the input clock to an on-chip CLOCK_SLICER, while the fref_xtal_in input can be used as an external crystal connection for internal high-frequency clock generation through an on-chip oscillator.

The SCRM can output four auxiliary clocks, fref_clk[0:3]_out. Output clocks 1 and 2 can be gated or enabled through associated clock request signals, fref_clk[1:2]_req.

Table 3-23 lists the external clock pins, signal names, their direction, associated module, and description of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

Table 3-23. External Clock Signals

Pin	Signal	I/O[1]	PMFW Module	Description	Module Reset Value
sys_32k	SYS_32K	I	SCRM	32-kHz clock input (sleep clock)	Z
fref_clk_ioreq	SYSCLK_REQ	I/O	SCRM	System clock request. Input when pins sysboot4 = 0 and sysboot5 = 0 (oscillator mode). Output when pins sysboot4 = 0 and sysboot5 = 1 (CLOCK_SLICER mode).	Z
fref_slicer_in	SLICER_IN	I	SCRM	System clock input to the CLOCK_SLICER. It can be sinusoidal or square input signal.	Z
fref_slicer_az	SLICER_AZ	I	SCRM	Connected to ground at package level	Z
fref_xtal_in	XTAL_IN	I	SCRM	Oscillator drive input from crystal	Z
fref_xtal_out	XTAL_OUT	O	SCRM	Oscillator drive output to crystal	NA
fref_xtal_clk	XTAL_CLK	O	SCRM	Oscillator buffered output	0
fref_clk[1:2]_req	CLK[1:2]_REQ	I	SCRM	Auxiliary clocks request	Z
fref_clk[0:3]_out	CLK[0:3]_OUT	O	SCRM	Auxiliary clocks outputs 0 to 3	For fref_clk0_out value is 0, for all rest value is Z

(1) I = Input; O = Output; I/O = Bidirectional

The signal on the oscillator buffered output (fref_xtal_clk) pin is a direct image of the signal on the fref_xtal_in input pin. The fref_xtal_clk pin provides the oscillator-generated clock to external devices. It is available when the oscillator is active or bypassed.

The XTAL_CLK clock signal is controlled by the CONTROL_CKOBUFFER register in the CTRL_MODULE_WKUP module. The CONTROL_CKOBUFFER register controls the following features of the oscillator output buffer:

- Output buffer enable signal - CONTROL.CONTROL_CKOBUFFER[31] CKOBUFFER_OUT_EN
- Selection of an alternate clock source for the input square signal - CONTROL.CONTROL_CKOBUFFER[30] CKOBUFFER_ALTSEL
- Polarity control for output clock signal - CONTROL.CONTROL_CKOBUFFER[29] CKOBUFFER_POLARITY
- Output clock enable control signal - CONTROL.CONTROL_CKOBUFFER[28] CKOBUFFER_CLK_EN

Copyright © 2013, Texas Instruments Incorporated

PRELIMINARY

NOTE: To enable the XTAL_CLK clock signal on the fref_xtal_clk pin, the CONTROL.CONTROL_CKOBUFFER[28] CKOBUFFER_CLK_EN bit must be set.

For information about the CONTROL_CKOBUFFER register, see Section 18.6, *Control Module Register Manual*, in Chapter 18, *Control Module*.

The auxiliary clocks are controlled by the configuration of the SCRM.AUXCLK <clock ID> (where the <clock ID> can be 0 to 4); for example, fref_clk1_out is controlled by the SCRM.AUXCLK1 register. It controls the following features:

- Select the clock-off output polarity
- Source clock input:
  - System clock
  - Clock from DPLL_CORE
  - Clock from DPLL_PER
- Initiate software-generated request
- Software-controlled clock gating
- Divide factor configuration between 1 and 16

NOTE: The SCRM provides a software control to enable and disable each output clock path. To allow the system clock (SYS_CLK) gating, all of the SCRM.AUXCLK<clock ID>[8] ENABLE bits must be cleared.

By default, the SCRM.AUXCLK<clock ID>[8] ENABLE bits are 0x0 after reset.

Software must clear the default reset value in the SCRM.AUXCLK4[8] ENABLE bit.

The bidirectional fref_clk_ioreq pad can be used to manage the external system clock request and auxiliary clock request 0. With this implementation, it is not expected to drive the system clock request externally when the SOC is the clock requester. This implementation requires programming the SCRM accordingly, in case the SOC needs the external system clock request. The programming consists in setting the AUXCLK0[9] DISABLECLK bit to 1 and the AUXCLKREQ0[4:2] MAPPING bit field to 0. Without these settings the SCRM wrongly interprets an external clock request as auxiliary clock request 0.

The SCRM must enable the output buffer of this bidirectional pad as long as it needs to request the external clock source, and the output buffer must be put in high-Z when it no longer needs the system clock source.

If device low-power mode is entered with fref_clk[1:2]_req active, then fref_clk[0:3]_out will be kept running from the system clock (SYS_CLK). LDO_WKUP stays in Active mode.
If fref_clk[1:2]_req is de-asserted while in low-power mode, then fref_clk[0:3]_out will be gated and LDO_WKUP will enter Sleep mode. SYS_CLK can be stopped.
If fref_clk[1:2]_req is re-asserted while in low-power mode, then fref_clk[0:3]_out will stay gated waiting for wake-up event that will trigger transition of LDO_WKUP to Active mode.

3.3.2 External Boot Signals

The PRM receives SYSBOOT[3:0] information from external pins sys_boot[3:0]. They are used to select interfaces or devices for the booting list. For more information, see Chapter 28, *Initialization*, Section 28.2.4.2, *Booting Device Order Selection*.

The SCRM receives SYSBOOT[5:4] information from external pins sys_boot[5:4]. They define the source clock configuration of the device. For more information, see Chapter 28, *Initialization*, Section 28.2.4.1, *Clock Source Selection*.

Table 3-24 lists the external boot pins, signal names, their direction, the associated modules, description, and reset values of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

PRELIMINARY

Table 3-24. External Boot Signals

Pin	Signal	I/O [1]	PMWF Module	Description	Module Reset Value
sys_boot0	SYSBOOT0	I	PRM	System boot configuration pin 0: Latched at power-on reset (POR)	Z
sys_boot1	SYSBOOT1	I	PRM	System boot configuration pin 1: Latched at POR	Z
sys_boot2	SYSBOOT2	I	PRM	System boot configuration pin 2: Latched at POR	Z
sys_boot3	SYSBOOT3	I	PRM	System boot configuration pin 3: Latched at POR	Z
sys_boot4	SYSBOOT4	I	SCRM	System boot configuration pin 4: Latched at POR	Z
sys_boot5	SYSBOOT5	I	SCRM	System boot configuration pin 5: Latched at POR	Z

(1) I = Input; O = Output; I/O = bidirectional

3.3.3 External Reset Signals

The SCRM manages two reset signals:

- POR input on the sys_nrespwron pin
- Warm reset on the sys_nreswarm pin

sys_nrespwron is asserted at device power up to reset the full logic in the device.

sys_nreswarm is a bidirectional pin. It can be activated at any time by an external device or an external reset push button action to cause a global warm reset event. The SCRM then holds sys_nreswarm to be driven out and maintained for a limited length of time at the boundary of the device. In this way, the device and its related peripherals are reset together.

The sys_reswarm and sys_nrespwron signals are active low.

Table 3-25 lists the external reset pins, signal names, their direction, associated module, and description of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

Table 3-25. External Reset Signals

Pin	Signal	I/O[1]	PMFW Module	Description	Module Reset Value
sys_nreswarm	SYS_WARM_RST	I/O	SCRM	Warm reset input and output	Z
sys_nrespwron	SYS_PWRON_RST_IN	I	SCRM	POR input	Z

(1) I = Input; O = Output; I/O = bidirectional

3.3.4 External Power Control Signals

The power control signals let the PMFW modules control the voltage levels of the device.

The voltage level of the scalable voltage sources in the external power IC can be scaled by sending commands to the power IC through a dedicated I^2C interface in the PRCM module. The clock and data pins for this I^2C interface are sr_pmic_scl and sr_pmic_sda, respectively.

The PRCM module can also command the external power IC to switch the device voltages to off level when the device is switched off, and reactivate them when it wakes up. This is managed through the signal on the sys_pwr_req pin.

Table 3-26 lists the pins, signal names, their direction, associated module, and description for the signals to the external power IC.

Table 3-26. Power Control Interface

Pin	Signal	I/O[1]	PMFW Module	Description	Module Reset Value
sr_pmic_scl	SR_PMIC_SCL	I/O	PRM	The SmartReflex dedicated I^2C interface clock line	1
sr_pmic_sda	SR_PMIC_SDA	I/O	PRM	The SmartReflex dedicated I^2C interface data line	1
sys_pwr_req	PWR_REQ	O	PRM	Power request to the external power IC to switch on or change the device power state	1

(1) I = Input; O = Output; I/O = bidirectional

3.3.5 External Voltage Inputs

Table 3-27 lists the external voltage sources related to the PRCM module.

NOTE: Table 3-27 lists only the voltage sources that are directly managed by the PRCM module or received by parts of the PRCM module (for example, DPLLs, LDOs, etc.). It does not give the device voltage sources not directly associated with the PRCM module.

Table 3-27. Voltage Sources

Pin	Signal	Managed by the PRCM	Description
vdd	VDD_CORE_L	Yes (AVS and DVFS)	Supplies VDD_CORE_L logic voltage domain
vdd_mpu	VDD_MPU_L	Yes (AVS and DVFS)	Supplies VDD_MPU_L logic voltage domain
vdd_mm	VDD_MM_L	Yes (AVS and DVFS)	Supplies VDD_MM_L logic voltage domain (that is, DSP and IVA)
vdda_dpll_core	VDDA_DPLL_CORE	No (fixed)	DPLL_CORE analog power supply

3.4 PRCM Subsystem Integration

The internal configuration registers of the power-management modules can be accessed for configuration and control through their respective L4_WKUP interconnect. In addition to the L4 interconnect, the internal module interface contains the following interfaces and signals:

- A set of signals for idle/wake-up control for each module
- Clocks and reset signals for the modules
- Power control signals (switches and memories) to the power domains
- Interrupts to the MPU, IPU, and DSP INTCs
- Voltage error commands from the SmartReflex modules to the external power IC
- Phase-locked loop (PLL) control commands for recalibration and bypass of the digital phase-locked loops (DPLLs)

Figure 3-18 shows details of the control interface to a generic power domain.

3.4.1 Device Power-Management Layout

The PMFW sees the device split into voltage domains, power domains, and clock domains. Table 3-28 provides the device-level view with module association to the clock, power, and voltage domains.

Table 3-28. PMFW Device-Level Layout

3.4.2 Power-Management Scheme, Reset, and Interrupt Requests

3.4.2.1 Power Domain

Table 3-29 lists the PMFW modules and their associated power domains.

Table 3-29. PMFW Module Power Domains

PMFW Module	Power Domain
SCRM	PD_WKUPAON
PRM	PD_WKUPAON
CM_CORE_AON	PD_COREAON
CM_CORE	PD_CORE
SMARTREFLEX_MPU	PD_COREAON
SMARTREFLEX_MM	PD_COREAON
SMARTREFLEX_CORE	PD_COREAON

The PRM part of the PRCM module is in the PD_WKUPAON power domain, which is continuously active. It is composed of the logic that must be permanently supplied to manage domain power-state transitions and detect wake-up events.

The CM_CORE_AON part of the PRCM module is in the PD_COREAON power domain, which is an always-on power domain, while the CM_CORE part of the PRCM module is in the PD_CORE power domain, which can be activated and deactivated according to the requirements of the executing applications.

3.4.2.2 Resets

The PMFW modules are reset by independent reset signals (see Table 3-30).

Table 3-30. PMFW Module Reset Signals

PMFW Module	Reset Signal
SCRM	SYS_PWRON_RST_IN
PRM	SYS_PWRON_RST_IN
CM_CORE_AON	CM_CORE_AON_PWRON_RST

3.5 Reset Management Functional Description

3.5.1 Overview

In the device, the reset scheme is managed by the following modules:

- SCRM: System-level reset management. It provides correct reset routing and sequencing when one or more devices are stacked together in the same package.
- PRM: Device-level reset management

3.5.1.1 SCRM Reset Management Functional Description

The SCRM handles the device power-on and warm reset pads, sys_nrespwron and sys_nreswarm resets. The SCRM:

- Extends the reset duration beyond the pad reset release
- Routes the device pad resets to the reset manager in the PRM module

The SCRM is functionally sensitive to the device POR. However, some of the register bits of the SCRM registers are reset when a device warm reset occurs.

3.5.1.1.1 Power-On Reset

The SCRM receives the device POR on the sys_nrespwron reset pad of the device. It extends the duration of the POR to the device PRM module until at least a stable 32-kHz clock can be provided to it. The 32-kHz clock version of the device is active once the SCRM releases the internal POR. The SCRM automatically deasserts the reset.

The SCRM automatically requests the system clock under a POR condition. This mechanism is functionally active on the 32-kHz clock.

The POR can also be asserted through software control. Software must enable the software reset assertion feature by setting the SCRM.EXTPWRONRSTCTRL[0] ENABLE bit and then by setting the SCRM.EXTPWRONRSTCTRL[1] PWRONRST bit to assert the reset.

3.5.1.1.2 Warm Reset

The device warm reset can be received from an external source through the sys_nreswarm warm reset pad or from the device PRM module as a result of an internal event.

The SCRM extends the duration of the device pad warm reset to the device PRM module.

The SCRM routes a warm reset source (that is, sys_nreswarm pad/PRM module) to a warm reset destination (that is, the PRM module).

The status of a warm reset source for each destination is logged in the corresponding SCRM.EXTWARMRSTST_REG[0] EXTWARMRSTST bit, when the destination reset is released. This is done at the 32-kHz clock.

Software must clear the reset status bit.

When one source of any global warm reset is detected, PRCM logic insures that all voltage domains have transitioned to ON state before starting warm reset sequence.

3.5.1.2 PRM Reset Management Functional Description

The PRM module manages the resets to all power domains inside the device.

NOTE: The PRM module has no knowledge or control over resets generated locally within a module (for example, through the <Module name>_SYSCONFIG[x] SOFTRESET configuration register bit). A software reset has the same effect on the module logic as a hardware reset.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

All PRM reset outputs are asynchronously asserted, while the deassertion is synchronous to the SYS_CLK clock. The reset managers in PRM use this clock for internal stall (delay) counter to delay deassertion of reset when the input reset source is deasserted.

In each power domain one or more reset domains are defined. A reset domain is defined by a unique reset signal that originates from the reset manager and is connected to one or more modules of the device. All the connected modules of the reset domain are reset simultaneously when the reset signal is asserted. Independent control of these reset domains allows sequencing of the release of resets and ensures a safe reset of the entire power domain.

NOTE: All internal reset signals are active low, including the DPLL reset signals.

3.5.2 General Characteristics of Reset Signals

Reset signals can be categorized based on four criteria:

- Scope: Global or local reset
- Occurrence: Cold or warm reset
- Source type: Software-controlled or hardware-triggered reset
- Retention type: Retention reset or nonretention reset

3.5.2.1 Scope

A reset signal can be categorized according to its scope (the area of the device affected by the reset):

- Global reset: Affects the entire logic of the device; all modules are reset. Generally, occurs when the device powers up or an abnormal operation is detected.
- Local reset: Affects one power domain, reset domain, or module. Generally, when a power domain transitions from a switched-off state to an active state, or when a software-reset control bit for a domain is set, only the group of modules within that domain is affected.

3.5.2.2 Occurrence

A reset signal can be categorized depending on when the reset occurs:

- Cold reset: Occurs only on device power up or in certain emulation modes. The cold reset is a global reset that affects every module in the device. It usually corresponds to the initial POR.
- Warm reset: Occurs when the device is in normal operating state. A module can use a warm reset to reset a subset of its logic. This is often done to speed up reset recovery time; that is, the time to transition to a safe operating state, compared to the time required upon receipt of a cold reset. Warm reset events include software-triggered reset per power domain, watchdog time-out, externally triggered and emulation initiated.

Modules that behave differently in cold reset and warm reset have two reset signals: RST and PWRON_RST. These reset signals reconstruct warm reset and cold reset in modules that require them.

The following modules are reset upon global cold reset events and not upon global warm reset events:

- All DPLLs associated with the PRCM module
- EMIF
- Control module: All the module instances in the PD_WKUPAON power domain

NOTE: For information about the PRCM module registers affected by the global warm reset, see the register description in Section 3.11, *PRCM Register Manual*.

3.5.2.3 Source Type

A reset can be categorized depending on whether it is software-controlled or hardware-triggered:

- Software reset: Triggered by setting a bit in a configuration register of the PRCM module

Copyright © 2013, Texas Instruments Incorporated

PRELIMINARY

- Hardware reset: Triggered by a signal from a hardware module inside or outside the PRCM module

3.5.2.4 Retention Type

The power domain manager in PRM controls the assertion of two types of local cold reset sources, retention and nonretention reset. They are identified by the naming convention <PowerDomain>_DOM_RET_RST and <PowerDomain>_DOM_RST, respectively.

Upon transitioning a power domain to the ON-ACTIVE power state from the OFF power state:

- Retention type reset source is always asserted.
- Nonretention type reset source is always asserted.

Upon transitioning a power domain to the ON-ACTIVE power state from a switched-off state:

- Retention type reset source is never asserted.
- Nonretention type reset source is optionally asserted. The software-selectable option enables the PRM to support the CSWRET retention mechanism. Nonretention type reset source is not asserted if the power domain state transitions from the CSWR-RETENTION state.

3.5.3 Reset Sources

The reset sources triggering the reset managers in the PRM are described in this section.

3.5.3.1 Global Reset Sources

Table 3-32 lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all the device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the bit triggering the reset is identified.

Table 3-32. Global Reset Sources

Type[(1)]	Name	Source/Control	Description
H/C	SYS_PWRON_RST	Received from the SCRM through input pin or through software control	The entire device is reset on power up.
H/W	SYS_WARMIN_RST	Received from the SCRM through input pin or through software control	External hardware warm reset
S/C	GLOBAL_COLD_SW_RST	PRCM module.PRM_RSTCTRL[1] RST_GLOBAL_COLD_SW	Global software cold reset
S/W	GLOBAL_WARM_SW_RST	PRCM module.PRM_RSTCTRL[0] RST_GLOBAL_WARM_SW	Global software warm reset
H/W	VDD_CORE_VOLT_MGR_RST	PRCM module	Asserted by the voltage manager FSMs when no response from the power IC is received during wake-up transition from retention or off mode
H/W	VDD_MM_VOLT_MGR_RST	PRCM module	
H/W	VDD_MPU_VOLT_MGR_RST	PRCM module	
H/W	TSHUT_MPU_RST	MPU voltage domain thermal sensor	Asserted when measured temperature is greater than shutdown temperature threshold
H/W	TSHUT_MM_RST	MM voltage domain thermal sensor	
H/W	TSHUT_CORE_RST	Device thermal sensor, placed close to the ISS, DSP, and IVA	
H/W	ICEPICK_RST	ICEPick™ module	It is used only in emulation mode.
H/W	ICEPICKPOR_RST	ICEPick module	It is used only in emulation mode.
H/W	MPU_WDT_RST	WD_TIMER2 or MPU subsystem	It is triggered by a time-out event.

(1) H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

3.5.3.2 Local Reset Sources

In addition to the global reset sources the device can have a number of local reset sources for each power domain. The local reset sources can be cold or warm reset sources. They can be software-controlled or hardware-triggered. Table 3-33 identifies the possible types of hardware-triggered local cold reset sources. Some power domains can support one or both of these local cold reset sources. The table does not list the software-triggered local warm reset sources that are listed in the reset management section of the respective power domains. A local reset source signal received by the reset manager resets only a specific part of the device (for example, some modules/subsystems within the power domain).

Table 3-33. Local Reset Sources

Type[(1)]	Name	Source/Control	Description
H/C	<Power domain>_RET_RST	PRCM	Asserted only for a power domain state transition to the ON-ACTIVE state
H/C	<Power domain>_RST	PRCM	Asserted for any power domain state transition to the ON-ACTIVE state

(1) H = Hardware reset, C = Cold reset

3.5.4 Reset Domains

A power domain can receive power-on reset (PWRON_RST) and/or normal reset (RST) signals. These signals reset nonretention logic and behave as follows:

- On any global or local cold reset, RST and PWRON_RST are asserted.
- On any global or local warm reset, only RST is asserted.

A power domain can receive two additional retention logic reset signals: power-on retention reset (PWRON_RET_RST) and/or retention reset (RET_RST). These signals behave as follows:

- On any global cold reset or wakeup from an off (no power supply) state to the ON-ACTIVE state, RET_RST and PWRON_RET_RST are asserted.
- On any global warm reset, only RET_RST is asserted.
- On wakeup from RETENTION state, these signals are not asserted.

This section discusses the trigger sources and attributes for all reset domains of the device. For an explanation of each reset trigger source of the device, see Section 3.5.3, *Reset Sources.*

Table 3-34 identifies the associated power and rest domains for each module.

LPRM_PWRON_RST	WKUPAON_GCLK	0x0	WKUPAON_ICLK clock is not active.
LPRM_RST	WKUPAON_GCLK	0x0	WKUPAON_ICLK clock is not active.

(3) ResetTime2 is set in the PRM_RSTTIME[14:10] RSTTIME2 bit field.

NOTE: WKUPAON_SYS_PWRON_RST is connected directly to the SYS_PWRON_RST source reset.

3.5.5 Reset Logging

A reset of the device is logged in two ways:

1. Dedicated registers in the PRCM module (the RM_<Power domain>_RSTST) log the reset sources to the power domain.
2. The control module logs the device reset activity in dedicated registers.

3.5.5.1 PRCM Module Reset Logging Mechanism

The reset status registers RM_<power domain>_RSTST and PRM_RSTST are reset asynchronously on assertion of a global cold reset. However, a reset status bit is always logged when the reset is released to the domain.

For this reason, after the assertion of a global cold reset, the reset status register is cleared to 0. When the domain reset is released, the register bit to log the global cold reset (the PRM_RSTST[0] GLOBAL_COLD_RST bit) is updated to 1. For the same reason, the reset status register of domains released from reset by software is updated only when software releases the domain reset.

The assertion of a global cold reset prevents logging any other source of reset until after the release of the domain reset. This is valid in the following situations:

- A source of reset other than global cold reset is asserted before, during, or after the active period of a global cold source of reset and before the release of the domain reset signal.
- A source of reset other than global cold reset is asserted and then released, but a global cold reset source is asserted before the release of the domain reset signal.

3.5.6 Reset Sequences

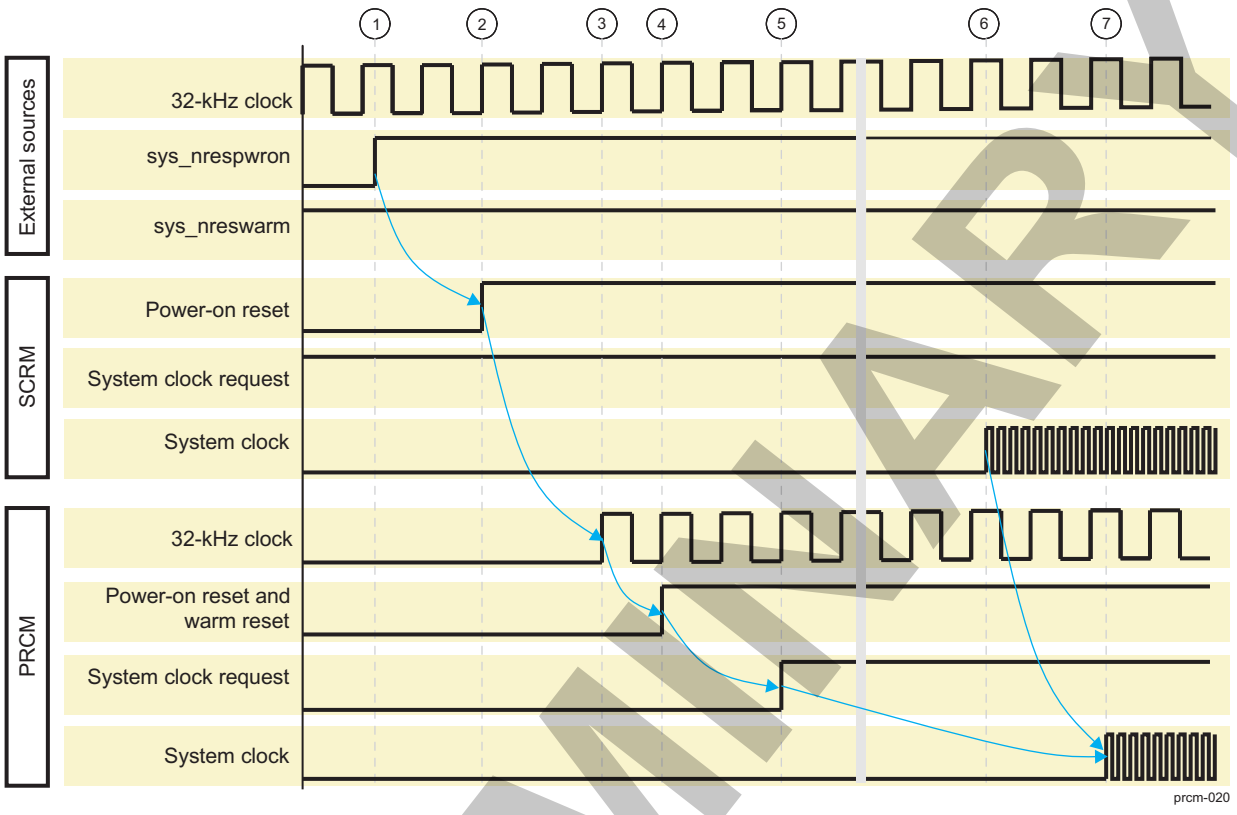
3.5.6.1 SCRM Power-On Reset Sequence

Figure 3-19 shows the power-on reset sequence as the reset is received by the SCRM, and the resulting interaction between the SCRM and PRCM modules. Figure 3-20 shows the power-on reset sequence within the PRCM module.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-19. SCRM Power-On Reset Sequence



The power-on reset sequence is:

1. The power-on reset pad is released from reset when the 32-kHz clock is already active.
2. SCRM releases its internal power-on reset clocked at the 32-kHz clock.
3. SCRM delays the release of the PRCM module resets to account for the stabilization time of the system clock source. It routes the 32-kHz clock to the PRCM module.
4. SCRM releases the PRCM module from reset (both power-on and warm reset).
5. The PRCM module asserts a system clock request to the SCRM.
6. Once the system clock setup-time counter overflows, the internal system clock version of SCRM is stable.
7. SCRM ungates the system clock to the PRCM module.

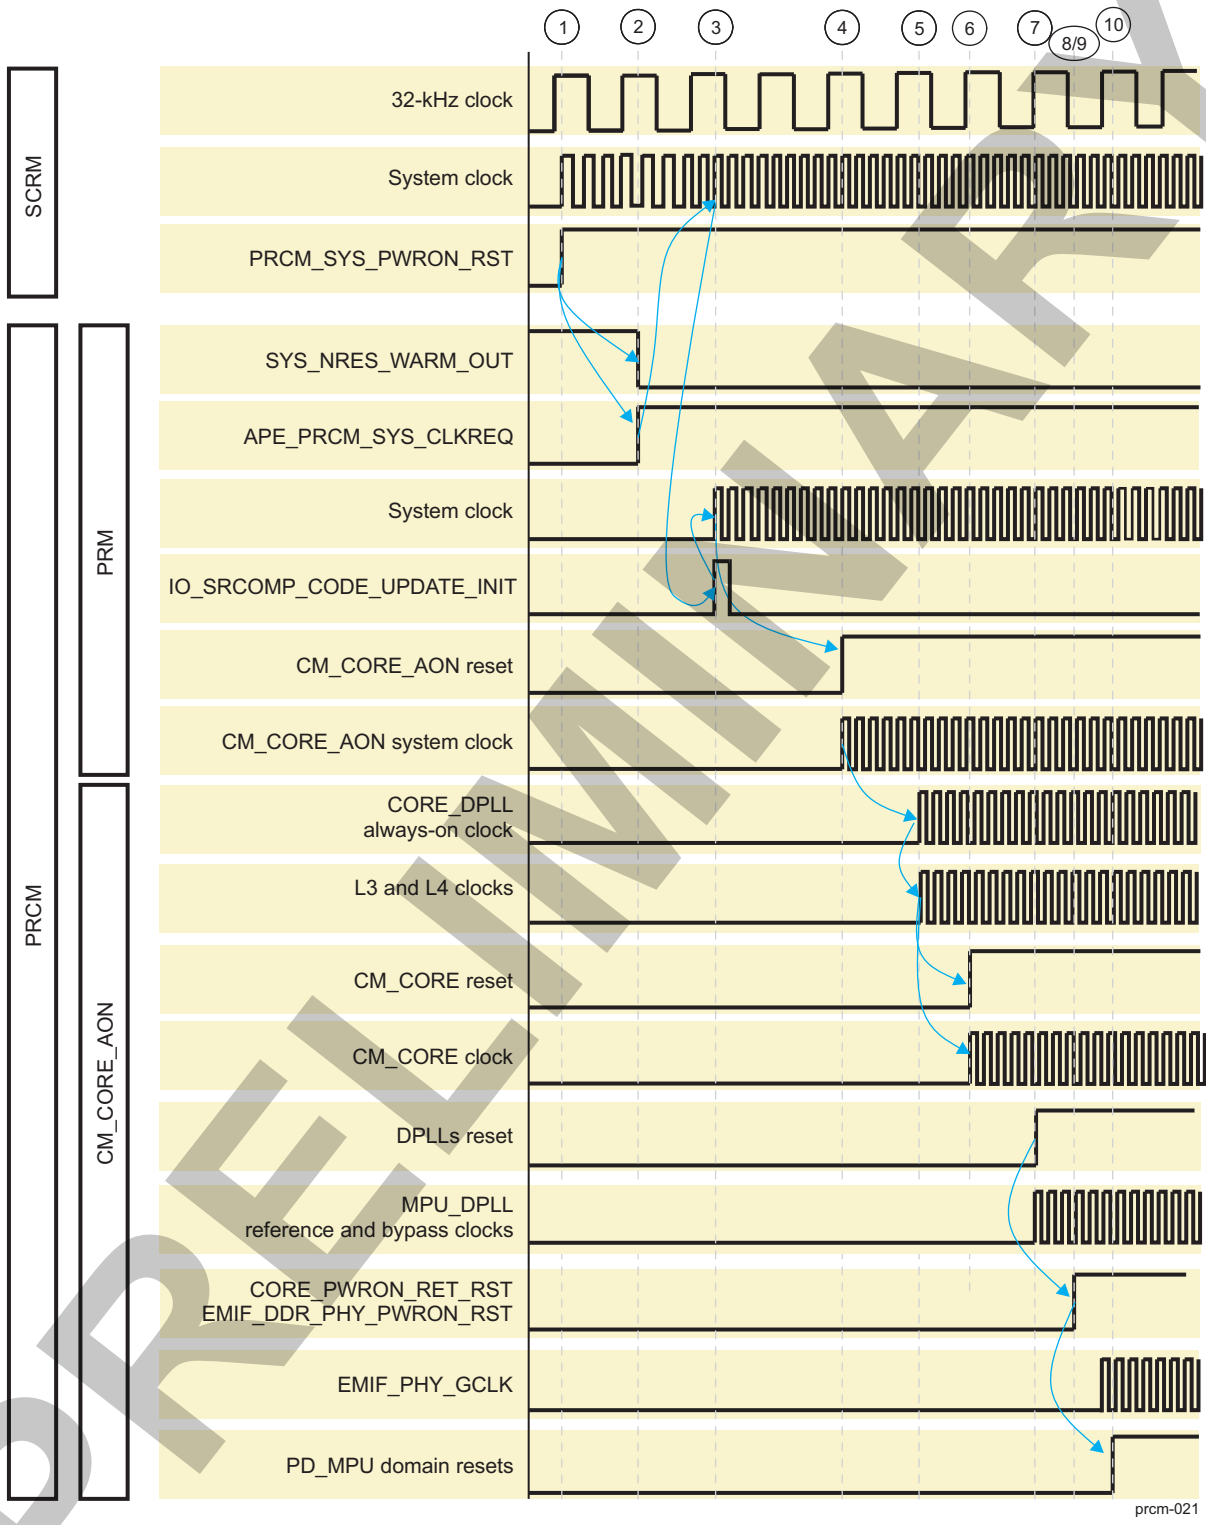
3.5.6.2 PRCM Module Power-On Reset Sequence

Figure 3-20 shows the power-on reset sequence.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-20. PRCM Module Power-On Reset Sequence



PRELIMINARY

The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The SCRM module is supplying the 32-kHz clock to the PRCM module and the clock is stable.
- The power-on reset (SYS_PWRON_RST_IN) has been released by the external power IC.

Copyright © 2013, Texas Instruments Incorporated

The power-on reset sequence is:

1. The SCRM releases a global power-on reset to the PRCM module (that is, PRCM_SYS_PWRON_RST). As a result, the PRCM module starts the Power-On Reset sequence.
2. The PRCM module releases SYS_NRES_WARM_OUT to the SCRM (only after all voltage domains are ramped up) after some 32-kHz clock cycles, and it also asserts APE_PRCM_SYS_CLKREQ to the SCRM module to request the system clock.
3. The SCRM provides the system clock to the PRCM module when the system clock source is stable. After LDOs stabilization, PRM generates IO_SRCOMP_CODE_UPDATE_INIT signal (one cycle pulse) used by the slew rate compensation cells to load default compensation code defined in CTRL_MODULE_CORE.
4. The PRM logic is then released from reset. The PRM provides CM_CORE_AON with a version of the system clock and releases CM_CORE_AON from reset.
5. CM_CORE_AON starts the reference clock (and also the bypass clock) of the CORE DPLL. In turn, the CORE DPLL, which is configured in bypass mode, generates the L3 clock (running at the system clock frequency at this stage). Now the CM_CORE_AON logic is fully operational: CM_CORE_AON logic is released from reset and the L3 clock is running.
6. CM_CORE_AON starts the L4 clock version for CM_CORE_AON, and the PRM deasserts the reset of CM_CORE.
7. The DPLLs are released from reset. The DPLLs can be released from reset before the L3 clock is running. The DPLL being under reset does not prevent the output clock from running. CM_CORE_AON starts the reference and bypass clocks to DPLL_MPU.
8. The CORE is released from reset, provided the L3 clock is running. The EMIF comes out of reset as soon as the CORE power domain power on retention reset (CORE_PWRON_RET_RST) (see Table 3-36) is released by the PRCM module. The PRCM module also releases EMIF_DDR_PHY_PWRON_RST. The EMIF_PHY_GCLK clock is not running at this point; hence, all the PHYs are asynchronously reset at the same time. The EMIF_PHY_GCLK clock is started later.
9. The PRCM module releases the IDLE request signal to the EMIF module once the EMIF functional clock is enabled. The EMIF then acknowledges the deassertion of IDLE request and becomes active.
10. The MPU subsystem is released from reset provided its clock is active and the L3 interconnect is operational.

NOTE:

- The PD_DSP and PD_IVA power domains are held under reset after power up by the assertion of software source of reset.
- After the power-up sequence completes, software must reprogram the value of the PRM_RSTTIME[9:0] RSTTIME1 bit field to ensure that in case of a new warm reset assertion, generated global warm reset is extended for a sufficient time (defined by the external power IC requirements).

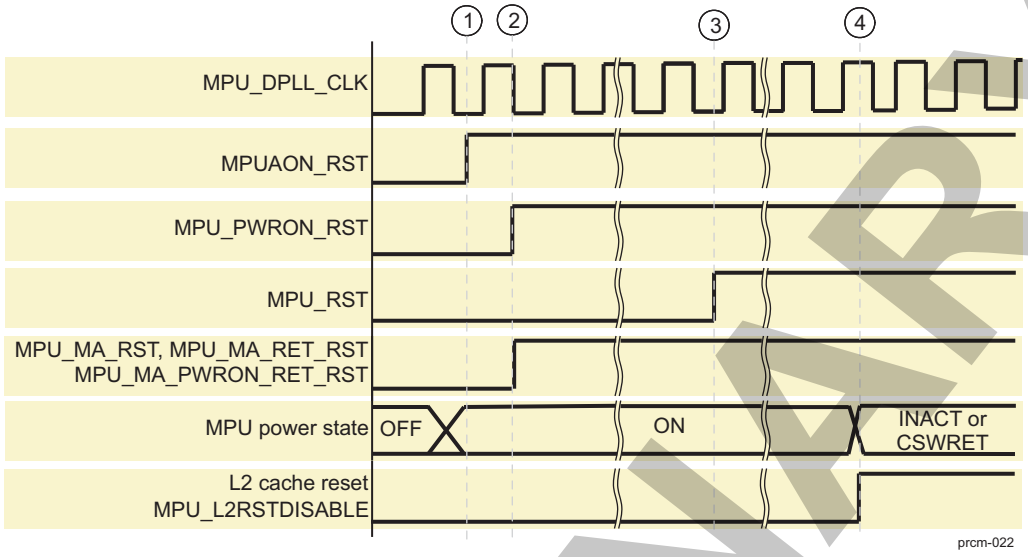
3.5.6.3 MPU Subsystem Power-On Reset Sequence

Figure 3-21 shows the POR sequence of the MPU subsystem.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-21. MPU Power-On Reset Sequence



The assumptions after power-on reset assertion are:

- The PRCM module provides the DPLL_MPU reference clock and the bypass clock.
- The PRCM module has released DPLL_MPU reset and DPLL_MPU is in bypass mode providing the clock (that is, bypass clock) to all the modules in the MPU subsystem.

The POR sequence is:

1. The PRCM module releases asynchronously in PD_MPUAON the MPUAON_RST reset to the INTC_MPU module in the MPU subsystem.
2. The PRCM module releases in PD_MPU the MPU_PWRON_RST (only after MPU_DPLL_CLK is active) to the MPU subsystem and waits until the subsystem completes its internal reset sequence. MA_MPU (Memory-adapter) dedicated reset signals (MPU_MA_RST, MPU_MA_RET_RST, and MPU_MA_PWRON_RET_RST) are released when MPU_DPLL_CLK is running (at the same time as MPU_PWRON_RST).
3. When the MPU subsystem internal reset sequence completes, the PRCM module releases in PD_MPU the MPU_RST signal and the MPU starts booting.
4. The PRCM module drives the MPU_L2RSTDISABLE signal low a minimum of 32 SYS_CLK cycles after MPU_RST is deasserted. The PRCM module keeps the MPU_L2RSTDISABLE signal low until the next power domain transition.

NOTE:

- The reset to the L2 cache memory (MPU_L2RSTDISABLE) in the MPU subsystem is asserted during initial POR (that is, when the PD_MPU wakes up from OFF state). It is also asserted during local or global warm reset. However, it is not asserted when the PD_MPU wakes up from RETENTION state (that is, when the logic is OFF and L2 memory is in RETENTION state). This ensures that the L2 cache is retained on wakeup.
- The L1 cache memory in the MPU subsystem is not retained on PD_MPU wakeup.

For more information about power management in the MPU subsystem, see Section 4.3.7, *MPU Subsystem Power Management*, in Chapter 4, *Dual Cortex-A15 MPU Subsystem*,

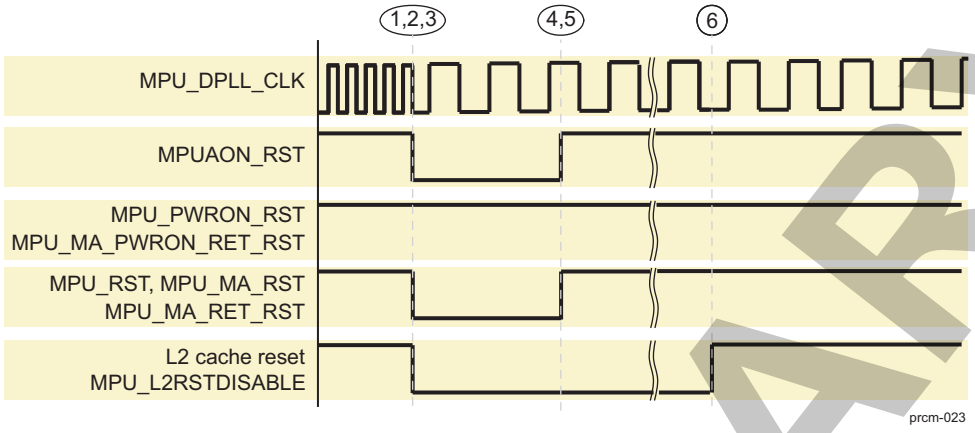
3.5.6.4 MPU Subsystem Warm Reset Sequence

Figure 3-22 shows the warm reset sequence of the MPU subsystem.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-22. MPU Warm Reset Sequence



The assumptions are:

- The DPLL_MPU is locked and is providing the clock to the MPU subsystem.
- A global or local warm reset to the MPU subsystem is asserted.

The warm reset sequence is:

1. The PRCM module asserts in PD_MPUAON the MPUAON_RST reset to the INTC_MPU module in the MPU subsystem. The MPU DPLL is locked.
2. The PRCM module asserts in PD_MPU the MPU_RST reset to the MPU subsystem and also asserts MPU_MA_RST and MPU_MA_RET_RST resets to the MA_MPU module.
3. The PRCM module resets the L2 cache memory in the MPU subsystem by asserting its reset.
4. The PRCM module releases the MPUAON_RST reset to the INTC_MPU module. The MPU DPLL is in bypass mode.
5. The PRCM module releases MPU_RST, MPU_MA_RST, and MPU_MA_RET_RST only after DPLL_MPU is in bypass mode and MPU_DPLL_CLK is stable and active.
6. The PRCM module drives the MPU_L2RSTDISABLE signal low a minimum of 32 SYS_CLK cycles after MPU_RST is deasserted. The PRCM keeps the MPU_L2RSTDISABLE signal low until the next power domain transition.

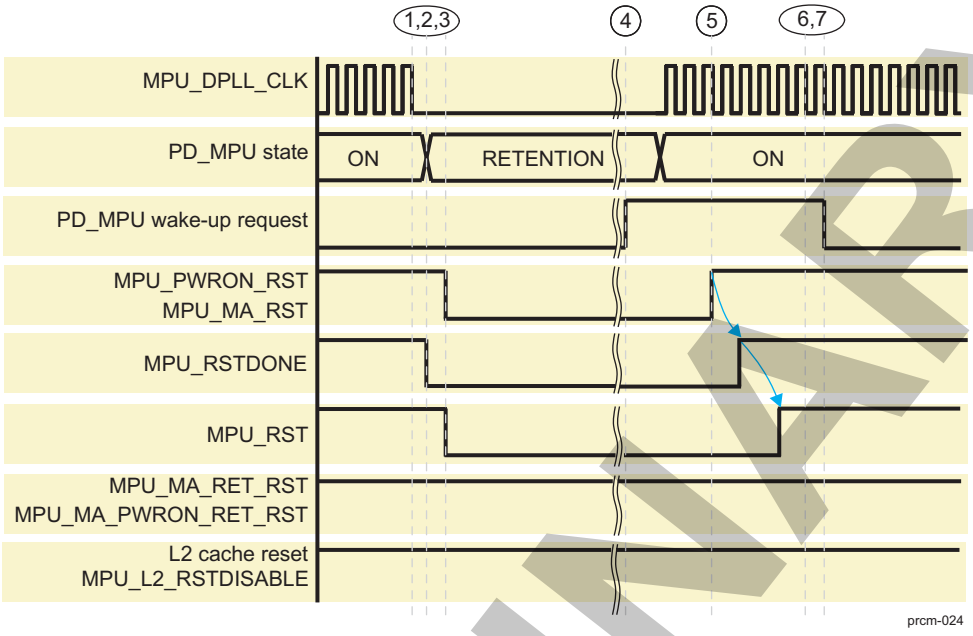
3.5.6.5 MPU Subsystem Reset Sequence on Sleep and Wake-Up Transitions From RETENTION and OFF States

Figure 3-23 shows the sleep and wake-up transitions reset sequence from the RETENTION and off (no power supply) states of the MPU subsystem.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-23. MPU Reset Sequence on Sleep and Wake-Up Transition



The assumption is:

- The DPLL_MPU is locked and is providing the clock to the MPU subsystem.

The sleep and wake-up transitions reset sequence is:

1. The PRCM module gates MPU_DPLL_CLK to the MPU subsystem.
2. The PRCM module switches PD_MPU to RETENTION state.
3. The PRCM module asserts MPU_PWRON_RST and MPU_RST resets to the MPU subsystem, and asserts MPU_MA_RST to the MA_MPU module. The entire logic in the PD_MPU is held in reset. The reset to the L2 cache memory in the MPU subsystem is not asserted if the logic in PD_MPU is held in reset.
4. The PRCM module resets the L2 cache memory in the MPU subsystem by asserting its reset.
5. The PRCM module releases MPU_RST only after the DPLL_MPU is in bypass mode and the MPU_DPLL_CLK is stable and active. The PRCM deasserts the MPU_PWRON_RST, MPU_MA_RST. When PRCM receives active MPU_RSTDONE signal from MPU, it de-asserts MPU_RST.
6. During the wakeup from RET state, the MPU_L2RSTDISABLE signal must be maintained at active high so the L2 cache will not be reset when the MPU is reset.

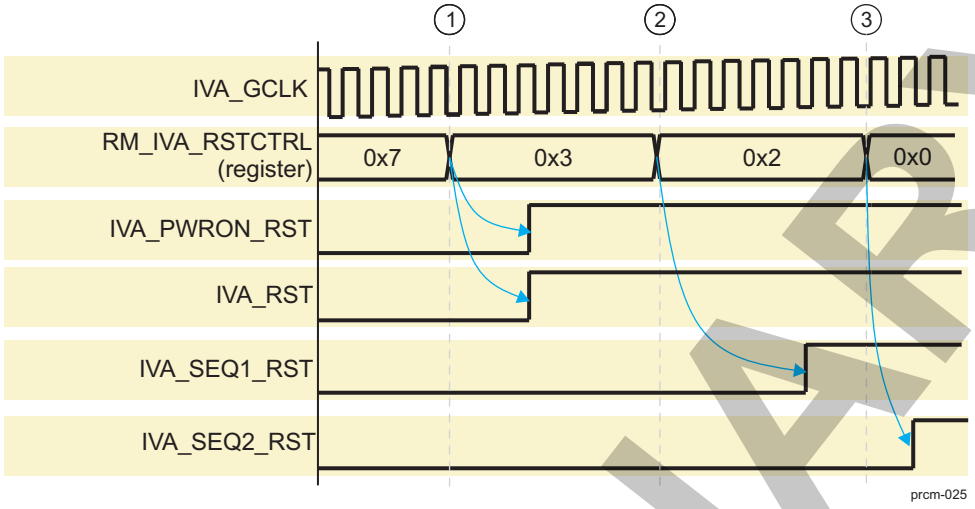
3.5.6.6 IVA Subsystem Power-On Reset Sequence

Figure 3-24 shows the power-on reset sequence of the IVA subsystem.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-24. IVA Power-On Reset Sequence



The power-on reset to IVA is applied when PD_IVA is powered. The assumptions after power-on reset assertion are:

- The PRCM module provides the IVA_GCLK functional clock to the IVA subsystem, and it has been enabled by MPU software control.

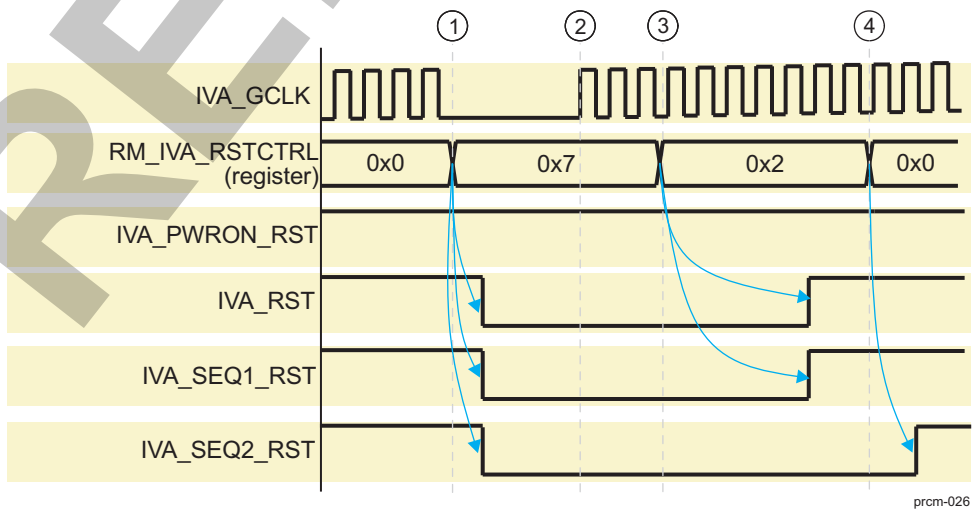
The power-on reset sequence is:

1. Software clears the RM_IVA_RSTCTRL[2] RST_LOGIC bit. This causes the PRCM module to release the IVA_PWRON_RST reset used inside IVA mainly to reset the emulation logic and the IVA_RST reset used to reset all logic inside IVA. Then software can download data into TCM memory while keeping the sequencer CPUs under reset.
2. When the TCM memory is initialized, software clears the RM_IVA_RSTCTRL[0] RST_SEQ1 bit. This releases IVA_SEQ1_RST reset to the Sequencer1 CPU.
3. Similarly, software can clear the RM_IVA_RSTCTRL[1] RST_SEQ2 bit. This releases IVA_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.7 IVA Subsystem Software Warm Reset Sequence

Figure 3-25 shows the software warm reset sequence of the IVA subsystem.

Figure 3-25. IVA Software Warm Reset Sequence



Before asserting the software reset to the IVA subsystem the MPU software must ensure that:

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

- IVA sequencer CPUs are in IDLE state (CM_IVA_IVA_CLKCTRL[17:16] IDLEST).
- The IVA subsystem is in STANDBY state (CM_IVA_IVA_CLKCTRL[18] STBYST).
- The functional clock to the IVA subsystem has been gated by the PRCM module (CM_IVA_CLKSTCTRL[8] CLKACTIVITY_IVA_GCLK).

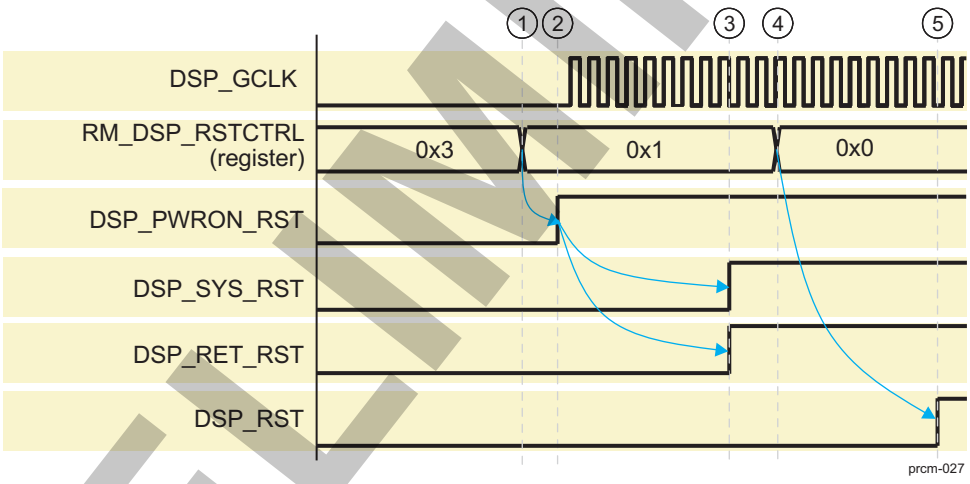
The software reset sequence is:

1. The MPU software sets the RM_IVA_RSTCTRL[2] RST_LOGIC, RM_IVA_RSTCTRL[1] RST_SEQ2, and RM_IVA_RSTCTRL[0] RST_SEQ1 bits. This causes the PRCM module to assert the IVA_RST, IVA_SEQ1_RST, and IVA_SEQ2_RST resets to the IVA subsystem. The IVA_PWRON_RST remains deasserted.
2. The MPU software enables the functional clock to the IVA subsystem.
3. The MPU software clears the RM_IVA_RSTCTRL[2] RST_LOGIC and RM_IVA_RSTCTRL[0] RST_SEQ1 bits. This causes the PRCM module to release the IVA_RST and IVA_SEQ1_RST resets to the IVA subsystem.
4. The MPU software clears the RM_IVA_RSTCTRL[1] RST_SEQ2 bit. This releases the IVA_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.8 DSP Subsystem Power-On Reset Sequence

Figure 3-26 shows the power-on reset sequence of the DSP subsystem.

Figure 3-26. DSP Subsystem Power-On Reset Sequence



The assumptions on power-on reset assertion are:

- PD_DSP is on.
- The MPU software sets the CM_DSP_DSP_CLKCTRL[1:0] MODULEMODE bit field to Auto (0x1).
- The MPU software sets the CM_DSP_CLKSTCTRL[1:0] CLKTRCTRL bit field to SW_WKUP or HW_AUTO.
- DPLL_IVA is active and is providing the DSP_GCLK. It can be locked before this sequence.

The Power-On Reset sequence is:

1. MPU software clears the RM_DSP_RSTCTRL[1] RST_DSP_MMU_CACHE bit in the PRCM module register to release the DSP, MMU_DSP, and CACHE_DSP interface from reset.
2. The PRCM module releases DSP_PWRON_RST when the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) reaches its limit. Upon deassertion of the POR signal, the DSP subsystem starts the initialization sequence. During this initialization sequence all the internal registers inside the DSP are properly reset and DSP, MMU_DSP, and CACHE_DSP interface are reset.
3. When the reset sequence of Step 2 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the DSP_SYS_RST and DSP_RET_RST signals.
4. MPU software must configure the MMU_DSP once the MMU_DSP is out of reset. After MMU_DSP

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

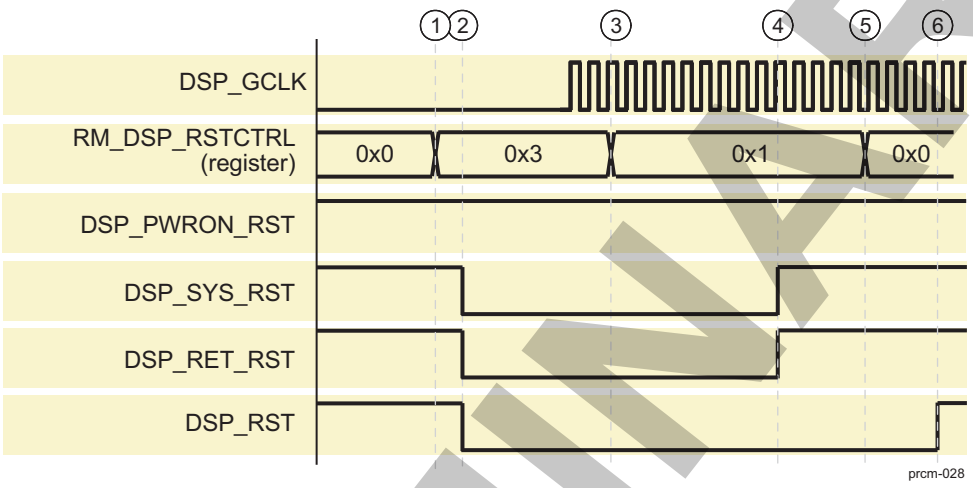
configuration is done, MPU software clears the RM_DSP_RSTCTRL[0] RST_DSP bit in the PRCM module register.

5. The PRCM module releases DSP_RST, which causes the DSP to start booting.

3.5.6.9 DSP Subsystem Software Warm Reset Sequence

Figure 3-27 shows the software warm reset sequence of the DSP subsystem.

Figure 3-27. DSP Subsystem Software Warm Reset Sequence



The assumptions on software warm reset assertion are:

- The DSP is in IDLE state.
- The DSP_GCLK (functional clock) is gated.

The software warm reset sequence is:

1. MPU software sets the RM_DSP_RSTCTRL[1] RST_DSP_MMU_CACHE and RM_DSP_RSTCTRL[0] RST_DSP bits.
2. The PRCM module asserts the DSP_SYS_RST, DSP_RET_RST, and DSP_RST reset signals. DSP_PWRON_RST remains deasserted in this case.
3. MPU software reenables DSP_GCLK and clears the RM_DSP_RSTCTRL[1] RST_DSP_MMU_CACHE bit in the PRCM module register to reset DSP, MMU_DSP, and CACHE_DSP interface. The DSP subsystem starts the partial initialization sequence for the warm reset.
4. When the reset sequence of Step 3 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the DSP_SYS_RST and DSP_RET_RST signals.
5. MPU software clears the RM_DSP_RSTCTRL[0] RST_DSP bit in the PRCM module register.
6. The PRCM module releases DSP_RST, which causes the DSP to start booting.

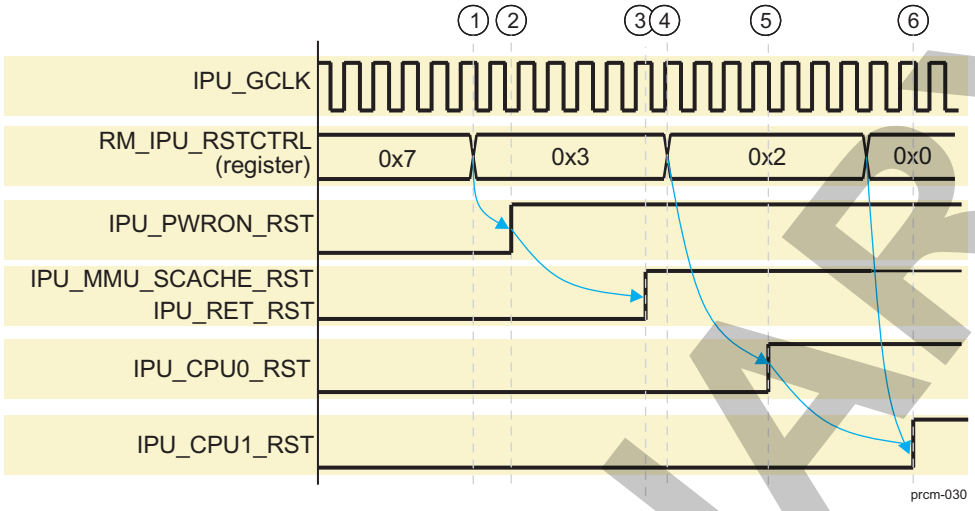
3.5.6.10 IPU Subsystem Power-On Reset Sequence

Figure 3-28 shows the power-on reset sequence of the IPU subsystem.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-28. IPU Power-On Reset Sequence



The assumptions on power-on reset assertion are:

- The IPU subsystem is held in reset by the PRCM module and the following are asserted:
  - IPU_PWRON_RST
  - IPU_RET_RST
  - IPU_CPU0_RST
  - IPU_CPU1_RST
  - IPU_MMU_CACHE_RST

The power-on reset sequence is:

1. Software clears the RM_IPU_RSTCTRL[2] RST_IPU_MMU_CACHE bit in the PRCM module register to release the IPU shared cache and CACHE_MMU_IPU from reset.
2. The PRCM module releases IPU_PWRON_RST once the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) reaches its limit and the IPU_GCLK is running. Upon deassertion of the POR signal, the IPU subsystem starts the CPU and CACHE_MMU_IPU initialization sequence.
3. When the reset sequence of Step 2 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU_MMU_CACHE_RST and IPU_RET_RST signals.
4. MPU software must configure CACHE_MMU_IPU once CACHE_MMU_IPU is out of reset. After CACHE_MMU_IPU configuration and cache initialization is done, MPU software clears the RM_IPU_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.
5. The PRCM module releases IPU_CPU0_RST, which causes IPU_C0 to start booting.
6. MPU software can clear the RM_IPU_RSTCTRL[1] RST_CPU1 bit in the PRCM module register so that the PRCM module releases the IPU_CPU1_RST to IPU_C1.

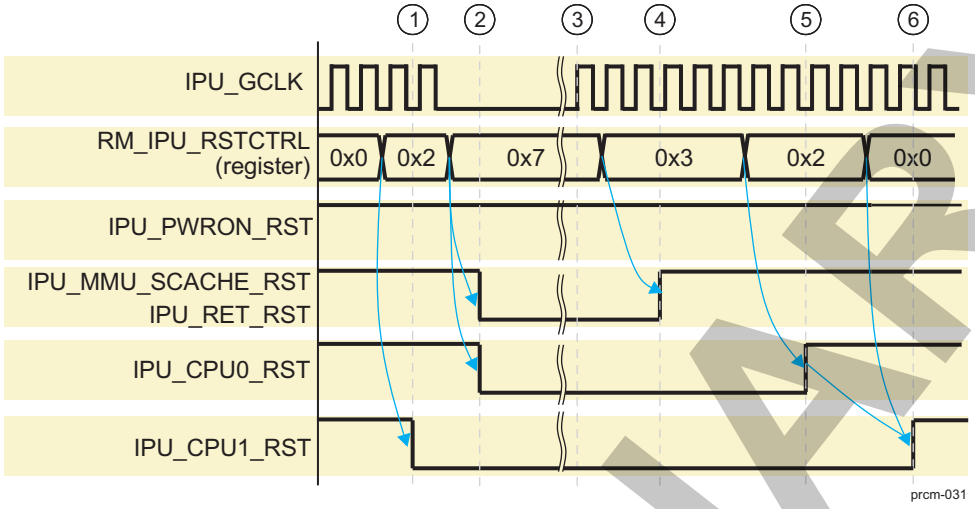
3.5.6.11 IPU Subsystem Software Warm Reset Sequence

Figure 3-29 shows the software warm reset sequence of the IPU subsystem.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-29. IPU Subsystem Software Warm Reset Sequence



For doing the software reset of IPU, the MPU software must ensure that IPU CPUs (IPU_C0 and IPU_C1) are in IDLE state and clock is gated

The software warm reset sequence is:

1. When IPU_C1 is in IDLE state, IPU_C0 software or MPU software sets the RM_IPU_RSTCTRL[1] RST_CPU1 bit. The PRCM module asserts the IPU_CPU1_RST reset signal to IPU_C1.
2. When IPU_C0 is in IDLE state, the MPU software sets the RM_IPU_RSTCTRL[2] RST_IPU_MMU_CACHE and RM_IPU_RSTCTRL[0] RST_CPU0 bits.
3. The PRCM module asserts the IPU_MMU_CACHE_RST, IPU_RET_RST, and IPU_CPU0_RST reset signals. The IPU_PWRON_RST remains deasserted in this case.
4. The MPU software reenables the IPU_GCLK and the initialization sequence starts inside the IPU subsystem. Software clears the RM_IPU_RSTCTRL[2] RST_IPU_MMU_CACHE bit and RM_IPU_RSTCTRL[0] RST_CPU0 bit in the PRCM module register.
5. When the reset sequence of Step 4 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the IPU_MMU_CACHE_RST, IPU_RET_RST, and IPU_CPU0_RST reset signals. IPU_C0 starts rebooting.
6. Software can then clear the RM_IPU_RSTCTRL[1] RST_CPU1 bit in the PRCM module register. The PRCM module releases the IPU_CPU1_RST reset signal to IPU_C1 to start booting.

3.5.6.12 Global Warm Reset Sequence

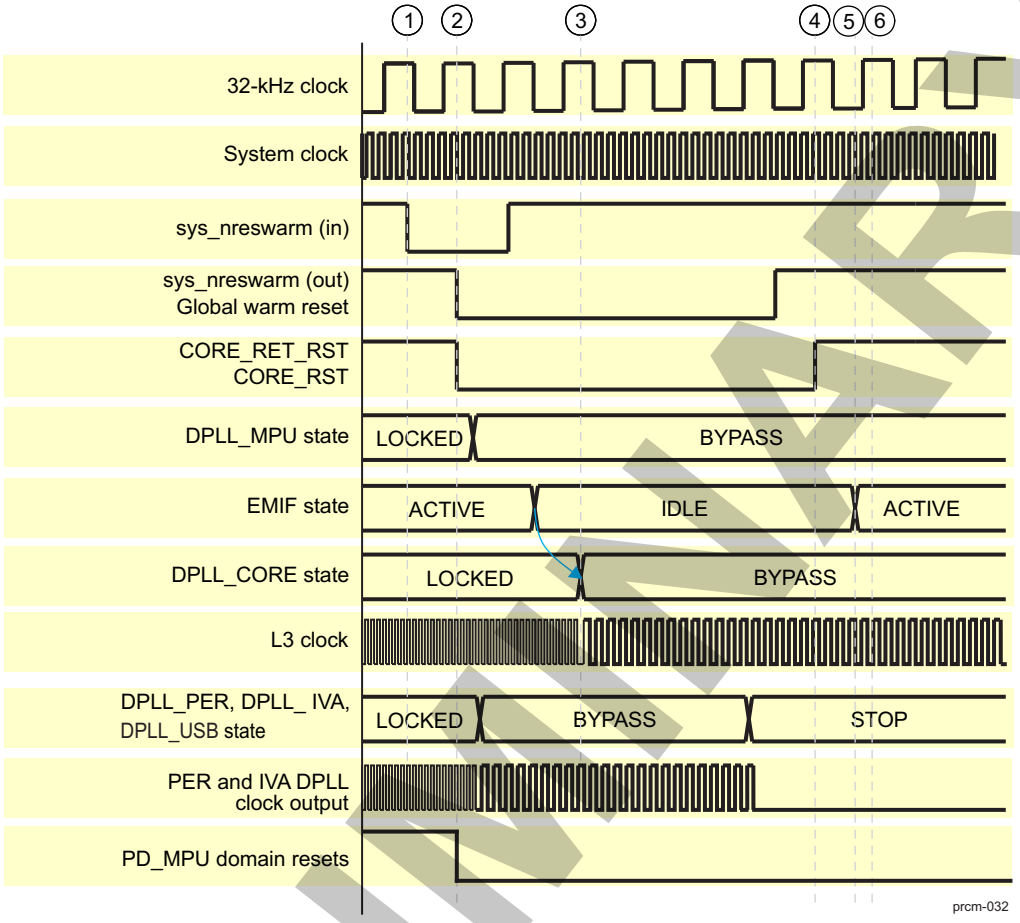
This section describes the global warm reset sequence.

Figure 3-30 shows the global warm reset sequence.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-30. Global Warm Reset Sequence



The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The device is active:
  - All resets are released.
  - MPU, CORE, and IVA DPLLs are locked.

The steps of a global warm reset sequence are:

1. On assertion of any global warm reset source the PRM signals the EMIF that a global warm reset event has occurred. The EMIF initiates the transition to IDLE state. The PRCM module delays global warm reset to the device for a minimum of 16 L3 clock cycles so that the EMIF switches to IDLE state and switches the external SDRAM to self-refresh mode.
2. The reset managers in the PRM assert the following resets:
   - The external warm reset SYS_WARM_RST (output) to the SCRM
   - All power domain warm resets are asserted.
   - DPLL hardware resets are not asserted.
     - DPLL_MPU transitions to bypass mode.
     - DPLL_CORE transitions to bypass mode once the EMIF switches to IDLE state.
     - DPLL_IVA, DPLL_PER and DPLL_USB transition to idle bypass low-power mode. Then as clock signals are no more requested, they are gated and these DPLLs goes to stop mode.
     - DPLL_ABE configuration is not changed.
   - The system clock remains active.
   - The PRM and CM registers, sensitive to warm reset, are asynchronously reset.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

- CM gates the clocks that are not needed, as per their default reset setting in the associated registers.

3. After the warm reset source is released, the global warm reset (internal and external) is extended until the following conditions are met:
   - The device reset manager counter overflows. It is set up by the PRM_RSTTIME[9:0] RSTTIME1 bit field. During this time, the DPLL_ABE control registers are reset and DPLL_ABE transitions to bypass mode when the system clock restarts and the DPLL_ABE outputs are no longer used.
   - All logic voltage sources (VD_MM, VD_MPU and VD_CORE) are stable.

NOTE: Voltage stabilization is an additional condition if voltage scaling was performed before the assertion of the warm reset.

4. The CORE power domain is released from reset (that is, warm reset-sensitive modules in the CORE power domain).
5. The PRCM module switches the EMIF from IDLE state back to ACTIVE state.
6. PD_MPU is released from reset when the clocks to the MPU subsystem are active. The MPU reboots.

NOTE:

- The PD_DSP and PD_IVA power domains are held under reset after global warm reset by assertion of the software source of the reset.
- The following are held under reset after global warm reset until the PRCM module enables their interface clock:
  - PD_L3INIT
  - PD_DSS
  - PD_GPU
  - PD_CAM

External power IC is sensitive to warm reset. When it detects a warm reset, it initiates its warm reset sequence to ramp all regulators.

3.6 Clock Management Functional Description

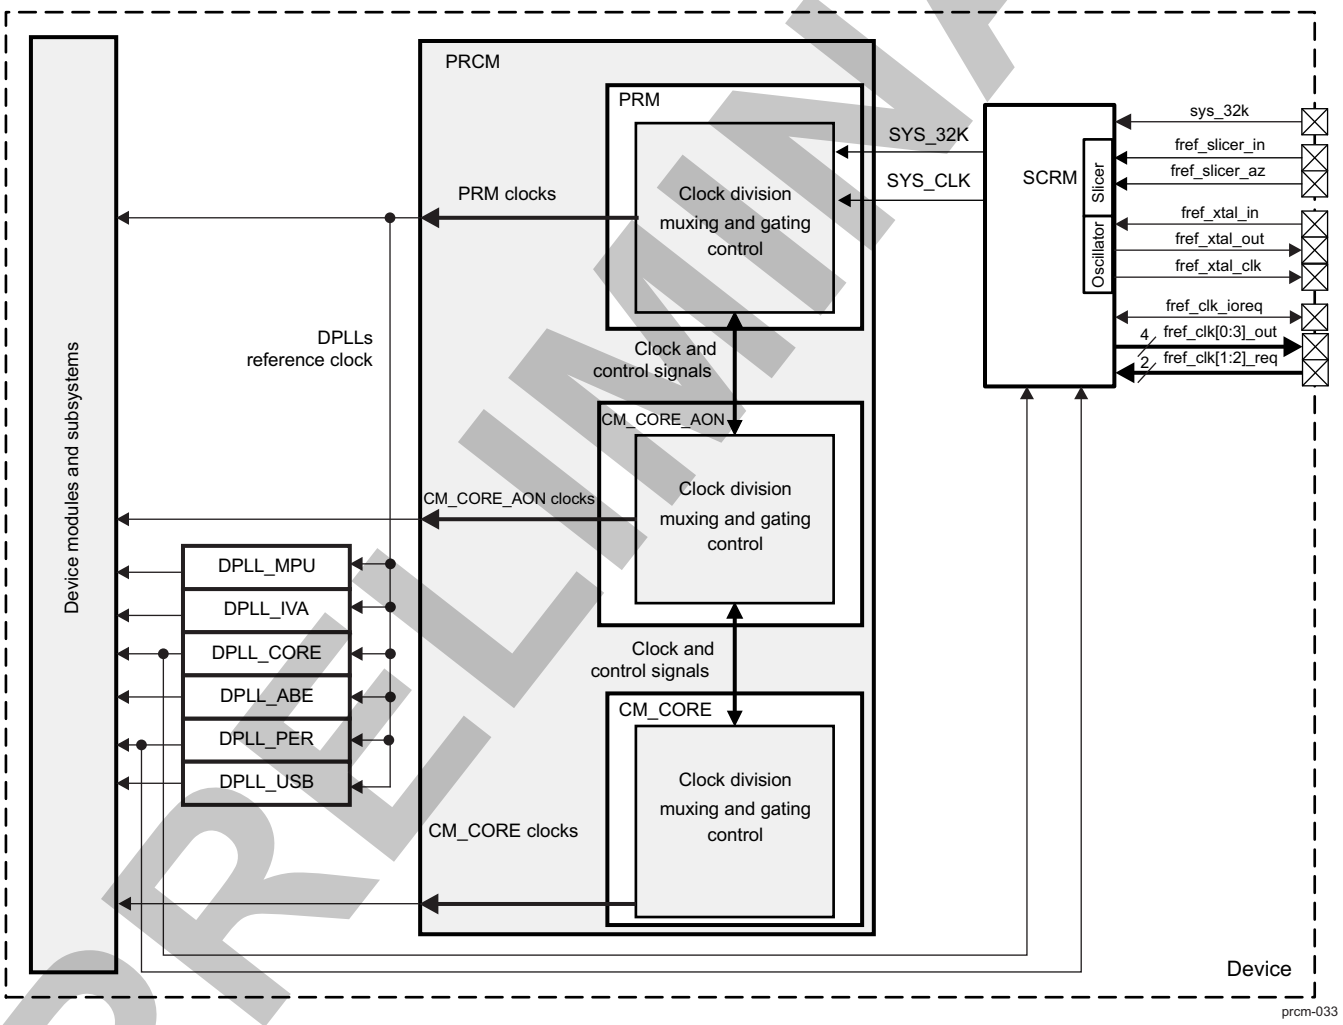
3.6.1 Overview

The PRCM module provides the control for clock generation, division, distribution, synchronization, and gating. It distributes the clock sources to all modules in the device. For information about the clock-management functional architecture of the device, see Section 3.1.1.1, *Clock Management*.

The high-frequency system clock is received by the device from an external source or generated within the device (internal oscillator) by the SCRM. The SCRM also receives the 32-kHz low-frequency clock from the external source.

The stable versions of the system and 32-kHz clock are provided by the SCRM to the PRCM module. The PRCM module provides clocks to the internal DPLLs for internal high-frequency clock generation. Clock division and gating are handled by the PRM, CM_CORE_AON, and CM_CORE sections of the PRCM module. Figure 3-31 shows the high-level clock-management scheme in the device.

Figure 3-31. PRCM Module Clock Manager Overview



3.6.2 External Clock Inputs

3.6.2.1 sys_32k Clock Input

The 32-kHz frequency is used for low-frequency operation (timer, debouncing, etc.). It supplies the always-on wake-up domain for operation in lowest power mode and as the clock source to the DPLL_ABE module (for audio back-end [ABE]).

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

3.6.2.2 High-Frequency System Clock Input

The system clock, SYS_CLK, is the main source clock of the device. SYS_CLK is received directly from the SCRM by the PRM subsection of the PRCM module. It is supplied as the reference clock to the DPLLs and as functional clock to several modules.

3.6.3 Internal Clock Sources/Generators

The PRCM module clock sources/generators are split into the following parts:

- PRM clock source that receives the 32-kHz and system clocks from SCRM
- CM_CORE_AON and CM_CORE clock sources that distribute high-frequency clocks
- DPLL clock generators that synthesize high-frequency clocks for the device

Table 3-37. Internal Clock Sources

Clock Name	Source	Frequency	Note
FUNC_32K_CLK	SYS_32K	32KHz	See Section 3.6.3.1, *PRM Clock Source*
SYS_CLKIN	SYS_CLKIN	12, 16.8, 19.2, 26, 38.4MHz	See Section 3.6.3.1, *PRM Clock Source*
FUNC_96M_AON_CLK	DPLL_PER	96MHz	See Section 3.6.3.4, *DPLL_PER Description*
FUNC_192M_CLK	DPLL_PER	192MHz	See Section 3.6.3.4, *DPLL_PER Description*
FUNC_256M_CLK	DPLL_PER	256MHz	See Section 3.6.3.4, *DPLL_PER Description*
CORE_CLK	DPLL_CORE	532MHz	See Section 3.6.3.5, *DPLL_CORE Description*

3.6.3.1 PRM Clock Source

The PRM clock source receives the SYS_32K and SYS_CLK clocks from the SCRM. Along with these clocks, it receives a clock (ABE_LP_CLK) from ABE, generated by DPLL_ABE. The PRM manages the low-frequency clocks associated with these three input clocks. The PRM sources various versions (through gating controls) of these externally sourced clocks to supply:

- PRCM-managed DPLLs with a reference clock, which is permanently supplied with always-on buffers
- The SMARTREFLEX modules with a reference clock, which is permanently supplied with always-on buffers
- The DSS with a reference clock, which is permanently supplied with always-on buffers
- The various timers and watchdog timers with clocks supplied by always-on buffers
- The clocks for the CM clock generator and the CORE power domain
- A version of SYS_CLK to ABE supplied by always-on buffers
- Timer functional clocks
- The bandgap and control module for thermal sensor feature
- Reference clock for various modules:
  - USB_OTG_SS
  - SATA

Figure 3-32 is a logical representation of the PRM clock source.

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

The PRM provides a 32-kHz gated and ungated clock for use by portions of the PD_WKUPAON power domain and some peripherals outside the PD_WKUPAON power domain.

It also provides the system clock to the DSS, a gated and buffered version to the WKUPAON_GICLK interconnect clock, and the DPLLs controlled by the PRCM module. The gated version of SYS_CLK is also provided to the SmartReflex modules of the device.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

PRM creates MMC1_32K_GFCLK, a gated version of SYS_32K provided to MMC1. This clock may be used by MMC1 for debouncing. It is controlled by the software through writing bit CM_L3INIT_MMC1_CLKCTRL[8] OPTFCLKEN_32KHZ_CLK.

3.6.3.1.1 CD_PRM_TIMER Overview

Figure 3-33 is an overview of the PRM clock manager related to the device timers.

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

3.6.3.2 CM Clock Source

The clock manager (CM) is primarily responsible for generating interface and functional clocks from the internal clocks provided by DPLL_CORE and DPLL_PER. The CM is physically divided into two independent entities: CM_CORE_AON, which is placed in the PD_COREAON always-on power domain, and CM_CORE, which is placed in the PD_CORE switchable power domain. The split is done to provide control over various entities, such as modules, DPLLs, and clocks, during low-power use case scenarios when the PD_CORE power domain can be switched to RETENTION state.

3.6.3.2.1 CM_CORE_AON Clock Generator

CM_CORE_AON receives a system clock from the PRM, which serves as its functional clock. CM_CORE_AON provides a gated clock to PD_ABE, PD_DSP, PD_MPU, and some DPLLs (DPLL_MPU, DPLL_IVA and its associated HSDivider,DPLL_ABE, DPLL_CORE and its associated HSDivider). It also provides the clock to the L3 and L4 interconnects in the device.

Mux MCBSP3 internal functional clock	CM_ABE_MCBSP3_CLKCTRL[27:26] CLKSEL_INTERNAL_SOURCE

NOTE: For the ABE subsystem, functional clock DPLL_ABE_X2_CLK must be set to 196.608 MHz in DPLL_ABE. ABE_CLK, which is sourced by the DPLL_ABE_X2_CLK, can be configured in the CM_CLKSEL_ABE[1:0] CLKSEL_OPP bit field according to the OPP. AESS_FCLK can be the same as ABE_CLK or ABE_CLK divided by 2, depending on the CM_ABE_AESS_CLKCTRL[24] CLKSEL_AESS_FCLK bit. For more information about setting DPLL parameters, see Section 3.6.3.3.1, *DPLLs Output Clocks Parameters*.

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*.

NOTE: For information about the CKGEN_ABE clock signals control and status, see Section 3.6.23, *CD_ABE Clock Domain*.

3.6.3.2.4 CKGEN_ISS Clock Generator

CKGEN_ISS receives clock signals from DPLL_CORE. It provides gated clock signals to CD_CAM and CD_IPU clock domains.

Figure 3-37 shows the various functional and interface clocks generated by CKGEN_ISS.

3.6.3.2.5 CM_CORE Clock Generator

The CM_CORE module is in the CORE power domain. Its clock generation part generates the clock sources for all peripherals and modules besides those generated by CM_CORE_AON. It generates several functional clocks (12, 24, 48, 96, 128, 192 and 256 MHz) that feed all its peripherals and modules besides containing clock control, muxes, gating, etc. for other power domains. These clocks are constant through OPP. CM_CORE also provides a gated clock to DPLL_PER and its associated HSDivider, DPLL_USB.

GPU_SYS_CLK can be a divide by 1 or a devide by 2 version of L3 clock. This divide ration is controlled with CM_GPU_GPU_CLKCTRL[26] CLKSEL_GPU_SYS_CLK bit.

Figure 3-38 and Figure 3-39 show the various functional and interface clocks generated by CM_CORE.

3.6.3.3 Generic DPLL Overview

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types: type A and type B DPLLs.

The following DPLLs belong to type A:

- DPLL_MPU
- DPLL_IVA
- DPLL_CORE
- DPLL_PER
- DPLL_ABE

The following DPLLs belong to type B:

- DPLL_USB

All DPLLs (type A and type B) support the features described in the following sections, unless otherwise identified.

NOTE: This chapter discusses only the DPLLs that are directly controlled by the PRCM module. The other DPLLs embedded in and managed by other subsystems are described in their respective subsystems. For example, Section 10.3.4.5, *DSI PLL Controllers,* in Chapter 10, *Display Subsystem*, discusses the DPLLs in the display subsystem.

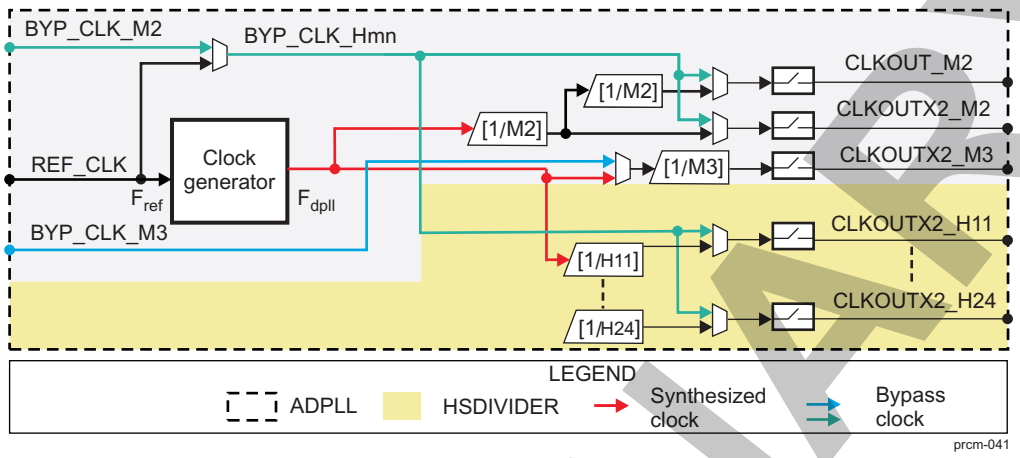
3.6.3.3.1 DPLLs Output Clocks Parameters

Figure 3-40 shows the functional architecture of a generic DPLL.

Figure 3-40. Generic DPLL Functional Diagram



The DPLL has three input clocks:

- REF_CLK: Used to generate the synthesized clock but can also be used as the bypass clock for some outputs of the DPLL whenever the DPLL enters bypass mode. It is mandatory for the DPLL clock synthesis.
- BYP_CLK_M2: Selectable bypass clock for the output of an M2 post-divider (optional)
- BYP_CLK_M3: Selectable bypass clock for the output of an M3 post-divider (optional)

The DPLL provides the bypass clock used by HSDIVIDER: BYP_CLK_Hmn, which is output by the multiplexer between the BYP_CLK_M2 and REF_CLK clock signals.

NOTE: The [1/2] divider located after the M2 post-divider is not valid when the CM_CLKSEL_DPLL_MPU[22] DCC_EN bit is set (applies only to DPLL_MPU when a frequency higher than 1.4 GHz is needed).

The DPLL can be programmed to be locked at any frequency given by one of the following equations:

- $F_{dpll} = F_{ref} \times 2 \times M / (N + 1)$
- $F_{dpll} = F_{ref} \times 2 \times (4 \times M / (N + 1))$ in case the CM_CLKMODE_DPLL_ABE[11] DPLL_REGM4XEN bit is set (applies only to DPLL_ABE)
- $F_{dpll} = F_{ref} \times (M / (N + 1))$ in case the CM_CLKSEL_DPLL_MPU[22] DCC_EN bit is set (applies only to DPLL_MPU when frequency higher than 1.4GHz is needed).

Where:

- F_{dpll} is the DPLL lock frequency.
- F_{ref} is the REF_CLK frequency. F_{ref} is also known as CLKINP.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

NOTE: It is preferred to minimize the value for N parameter (it minimizes lock time and jitter). Then M should be chosen to provide correct frequency (with lowest delta as possible).

It internally generates three main clocks: CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 as shown in Table 3-44.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Table 3-44. CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 Frequencies With DPLL State

Output	Equation	DPLL Mode
CLKOUT_M2	F_{dpll} / (2 x M2)	Locked (typical case)
	F_{ref} or BYP_CLK_M2	Before lock or during relock
	F_{dpll} / M2	DC corrector logic is used (DCC_EN bit is set).
CLKOUTX2_M2	F_{dpll} / M2	Locked (typical case)
	F_{ref} or BYP_CLK_M2	Before lock or during relock
	F_{dpll} / M2	DC corrector logic is used (DCC_EN bit is set).
CLKOUTX2_M3	F_{dpll} / M3 or BYP_CLK_M3/M3	Locked (typical case)
	0	Before lock or during relock
	F_{dpll} / M3 or BYP_CLK_M3/M3	DC corrector logic is used (DCC_EN bit is set).

Where:

- M2 is the software-configured division ratio binary value.
- M3 is the software-configured division ratio binary value.
- CLKOUT_M2 and CLKOUTX2_M2 bypass clock input can be switched when the DPLL is not in locked state by using the M2 bypass clock select control bit.
- CLKOUTX2_M3 output clock can be switched when the DPLL is in locked state by using the M3 clock select control bit.

NOTE:

- A value of 0 for M2 and M3 division ratios is not allowed. They are set to 1 after reset.
- CLKOUT_M2 is generated based on a fixed divide-by-2 ratio, except in bypass mode.

The DPLL can contain one or two HSDIVIDER modules to produce more clocks with divided ratio based on the DPLL synthesized clock frequency. HSDIVIDER1 provides four extra post-dividers from H11 to H14 (the output clocks are CLKOUTX2_H11 through CLKOUTX2_H14). HSDIVIDER2 provides four extra post-dividers from H21 through H24 (the output clocks are CLKOUTX2_H21 through CLKOUTX2_H24). The HSDIVIDER output clock frequency is given by the equations in Table 3-45.

Table 3-45. CLKOUTX2_Hmn Frequencies With DPLL State

Equation	DPLL Mode
CLKOUTX2_Hmn = F_{dpll} /(Hmn + 1)	Locked
CLKOUTX2_Hmn = BYP_CLK_Hmn	Before lock or during relock

Where:

- F_{dpll} is the DPLL lock frequency.
- (Hmn + 1) is the software-configured division ratio binary value.
- n is in the range from 1 to 4.
- m is equal to 1 or 2.

NOTE: Hmn + 1 division ratio is set to 1 after reset. 63 (0x3f) is an illegal value.

All clock outputs of the DPLL can be gated. The PRCM module provides the DPLL with a clock-gating control signal to enable or disable the clock. DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated. The PRCM module provides a CM_IDLEST_DPLL_dpll_name[0] ST_DPLL_CLK status bit, which indicates the lock state or nonlock state of the DPLL.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

The type B DPLL (DPLL_USB) has two outputs: CLKOUT and CLKDCOLDO. The DPLL can be programmed to be locked with the output clock frequencies given by the following equation:

- $F_{clkout} = F_{ref} \times (M / (N + 1)) \times (1 / M2)$
- $F_{clkdcoldo} = F_{ref} \times (M / (N + 1))$

Where:

- F_{clkout} is the frequency of the clock at output CLKOUT.
- $F_{clkdcoldo}$ is the frequency of the clock at output CLKDCOLDO.
- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.
- M2 is the software-configured division ratio binary value.

CLKOUT supports the same bypass modes as previously identified. CLKDCOLDO does not support bypass mode.

The type B DPLL output clock is synthesized by an internal oscillator that is phase-locked to the REF_CLK. Two oscillators are built within a type B DPLL. The oscillators are user-selectable based on the synthesized output clock frequency requirement. If the required frequency is greater than or equal to 1500 MHz, the user must program a value of 1 in the CM_CLKSEL_DPLL_dpll_name[21] DPLL_SELFREQDCO bit. This drives a value of 100 on the SELFREQDCO input of the corresponding type B DPLL. If the required frequency is less than 1500 MHz, the user must program a value of 0 in the CM_CLKSEL_DPLL_dpll_name[21] DPLL_SELFREQDCO bit. This drives a value of 010 on the SELFREQDCO input of the corresponding type B DPLL.

3.6.3.3.2 Enable Control, Status, and Low-Power Operation Mode

The DPLL has a manual mode control bit field, which allows the setting of the different operating modes of the DPLL. When the DPLL is switched to lock mode, the current values of the multiplication ratio (M) and the division ratio (N) are latched in the DPLL. The DPLL then starts the lock or relock sequence to synthesize the corresponding output frequency clock.

The status of the synthesized clock output of the DPLL is represented by the CLKOUT status bit. It can be gated or active.

The type A DPLLs can be switched to low-power operation mode (also called LPMODE) to optimize DPLL power consumption when the input and output clock frequencies are low. This mode can be software-enabled using the low-power mode control bit of the DPLL.

It must be enabled only if both of the following operating conditions are satisfied:

- $F_{ref} / (N + 1)$ is less than or equal to 1 MHz.
- $F_{ref} \times M / (N + 1)$ is less than or equal to 100 MHz.

Where:

- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

3.6.3.3.3 DPLL Power Modes

DPLL supports several power modes for type A and only one power mode for type B. Each mode results in a tradeoff between power savings and relock time. The PRCM module allows only a few modes for each DPLL, depending on the use of the DPLL.

Table 3-46 lists the DPLL power modes.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Table 3-46. DPLL Power Modes

Power Mode	CLKOUT State	Logic Current (mA)	Analog Current (mA)	Freq Lock Time	Phase Lock Time
Low-power stop	Clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Fast-relock stop	Clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Low-power bypass	Bypass clock/clock stopped	0.065 (leakage)	0.009 (leakage)	2.5 µs + (70 × (N+1) / F_{ref})	2.5 µs + (120 × (N+1) / F_{ref})
Fast-relock bypass	Bypass clock/clock stopped	0.065 (leakage)	0.5 (leakage)	0.05 µs + (70 × (N+1) / F_{ref})	0.05 µs + (120 × (N+1) / F_{ref})
Lock	Synthesized clock	0.95 (active)	3 (active)	N/A	N/A

Where:

- F_{ref} is the REF_CLK frequency.

A DPLL power mode can be achieved on a software request (manual) and/or automatically (automatic), depending on the specific hardware conditions.

A DPLL can switch from one mode to another as a result of the following:

- Software-programmed transition (manual): Software configures the dedicated DPLL manual mode control feature for the next desired DPLL mode. It must ensure that the transition can be performed based on the clock activity on the device.
- Combined software-programmed and hardware-conditions-based transition (auto): This mode allows the DPLL to automatically transition to a low-power state (that is, any state other than the LOCK state) when the output clocks are gated or the destination clock domain is inactive, and to switch back to the LOCK state when the output clock is needed (that is, the clock is ungated or the clock domain becomes active). The desired low-power state for the automatic transition is configured in the dedicated Auto Mode Control parameter of the DPLL.

NOTE: With T_{ref} = 1 / F_{ref} = (N + 1) / CLKINP; (Fref = CLKINP / (N + 1)):

$T_{ref}$is the REF_CLK period.

This formula indicates that a smaller N divider value provides a smaller time for switching the clock after an M2 post-divider change.

A compromise is necessary between the clock switching latency and power consumption. Having a smaller N value:

- Requires a higher M2 post-divider value to obtain the same target frequency.
- Results in a higher DPLL lock frequency, and then higher power consumption.

NOTE:

- A manual transition can be performed from any power mode to any other power mode.
- An automatic transition can be performed from lock mode to any low-power mode.

NOTE: When the DPLL is in Low-power bypass mode, Auto-idle mode is disabled and no clock is requested, the DPLL makes a transition to Low-power stop mode. Thus the device can switch off even if the DPLL is set to Low-power bypass mode.

PRELIMINARY

3.6.3.3.4 DPLL Recalibration

The DPLL recalibration applies only to type-A DPLLs. Each time the DPLL is reset or performs a lock sequence (following a change in the value of multiplier M or divider N), it performs a recalibration of the output frequency, based on voltage and temperature conditions. In lock mode, the DPLL maintains a steady lock frequency output by compensating for voltage and temperature changes within a certain range. However, if the voltage or temperature drifts outside the range or shows a significant or fast change, the DPLL may not be able to track and compensate it. It would need a recalibration, which is signaled by assertion of a recalibration flag.

NOTE:

- The recalibration mechanism is active only while the DPLL is in lock mode. When the DPLL is in off or bypass mode (low-power or fast-relock), it does not assert the recalibration flag.
- If the DPLL drifts out of the operating range limits while not locked, and then when it tries to relock, it fails to lock within the normal delay and recalibrates automatically before eventually locking. The only difference between this case and a standard relock is the recalibration delay.

During recalibration, the DPLL loses lock and output clock switches to the bypass clock.

The DPLL can automatically start recalibration when the recalibration flag is asserted, or recalibration can be triggered by software control. The trigger setting of the recalibration can be configured by the corresponding registers of the DPLL in the PRCM module. The software-controlled recalibration mode is selected by default.

Software-controlled recalibration: The DPLL continues its tracking mechanism as long as the recalibration is not triggered by software (that is, by enabling the recalibration-enable control parameter). If the DPLL reaches upper or lower bounds of the DCO control code and software has still not triggered recalibration, the DPLL stops its tracking mechanism. The output clock remains active, but frequency and jitter are not ensured to meet the requirement.

Automatic recalibration: The DPLL immediately starts the recalibration as soon as the recalibration flag is asserted.

NOTE: Automatic recalibration of the DPLL can start at any time. While relocking, the DPLL switches to bypass mode, which introduces a frequency change. For modules that are sensitive to frequency change while operating, this can introduce operational instability. For example, the external memory EMIF controller is sensitive to a frequency change on the DPLL because its embedded DLL relocks on a frequency change. Any EMIF access during this DLL relock period can be corrupted. It is, therefore, important to stall EMIF access during DPLL recalibration.

To allow software to recalibrate the DPLL at the correct time depending on the device activity, the PRCM module can generate a wake-up event on the processor power domain, followed by an interrupt on the processor subsystem when the DPLL recalibration flag is asserted.

Table 3-47 lists the DPLL recalibration and control parameters.

Table 3-47. DPLL Recalibration Control Parameters

Parameter	Register	Description
Recalibration-enable control	CM_CLKMODE_DPLL_<module>[8] DPLL_DRIFTGUARD_EN	Enable/disable the DPLL automatic recalibration feature.

3.6.3.3.5 DPLL Spread Spectrum Clocking

The synthesized clock output of the DPLL has a stable frequency. This periodicity generates a significant power peak at the selected frequency, which in turn causes an electromagnetic interference (EMI) disturbance to the environment. In communication devices, this clock signal generates unwanted spurious signals that interfere with the decoding of information received. It results in performance degradation; for example, in the form of high bit-error rates in case of a wireless communication interface.

To reduce the power peaks (and the electromagnetic noise generated at a specific frequency), an internal frequency modulation of the DPLL is used to distribute the energy to many different frequencies, thereby reducing the power peaks. This is called spread spectrum clocking (SSC). DPLL supports triangular SSC.

SSC in the DPLL is performed by changing the feedback divider (M) in a triangular pattern. This varies the frequency of the output clock in a triangular pattern. The frequency of this pattern is the modulation frequency (fm). It is programmed as a ratio of the REF_CLK/4. This frequency modulation feature is directly integrated into some DPLLs of the device.

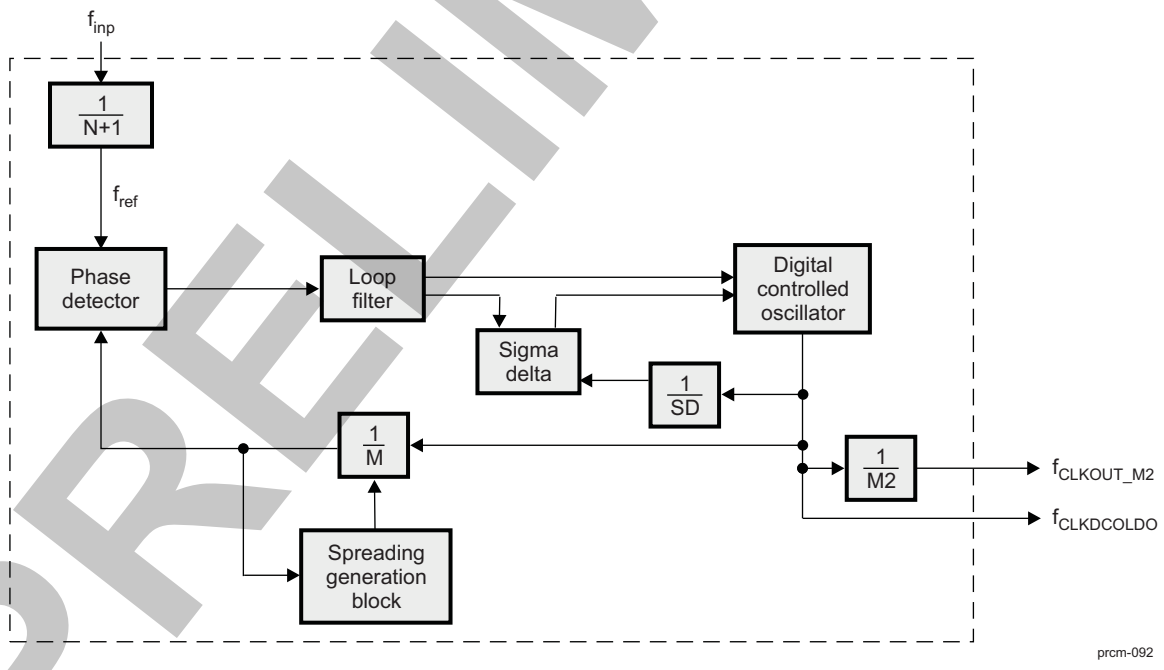
Figure 3-43. Type B DPLL With SSC Reduction Feature

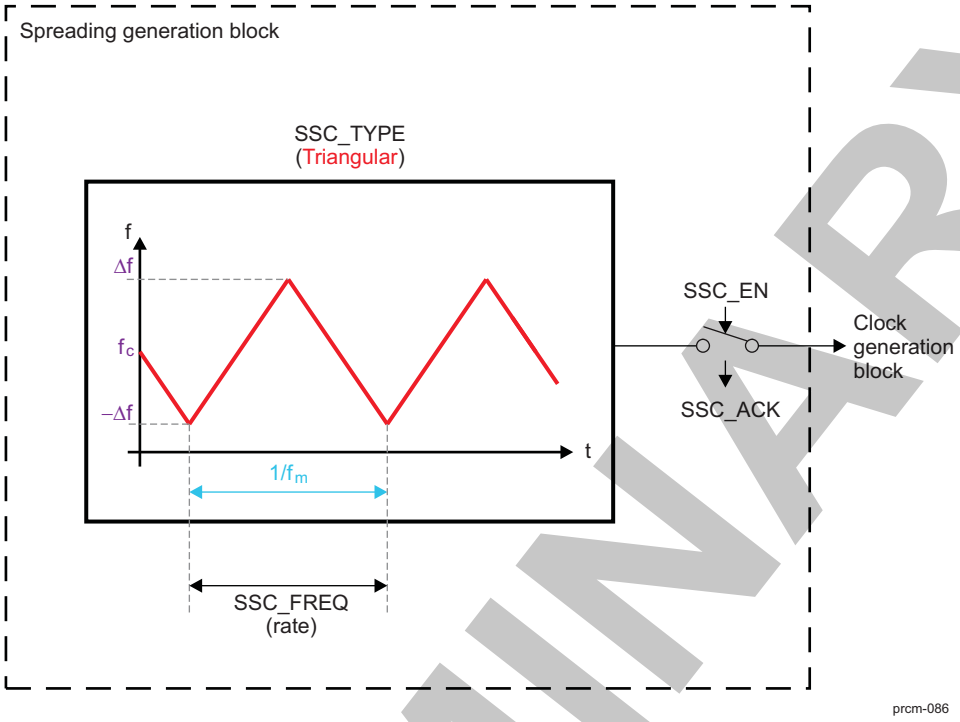


shows a diagram of the spreading generation block.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-44. Spreading Generation Block Diagram



NOTE: Δf is the deviation from the center frequency. The total spreading deviation is equal to twice Δf. The peak (ΔM) or the amplitude of the triangular/square pattern as a percent of M would be equal to the percent of the frequency spread (Δf), $\Delta M/M = \Delta f/f_c$.

f_c is the original output clock frequency.

f_m is the spreading frequency.

This additional block generates the required waveform used to reduce EMI. This waveform is then modulated with the initial signal to add some controlled deviation to the clock signal frequency, which spreads the energy of the clock and its harmonics into a band of frequencies, and then reduces EMI. SSC_DOWNSPREAD can control the position of the generated signal. It is controlled by the CM_CLKMODE_DPLL_<module>[14] DPLL_SSC_DOWNSPREAD bit of the corresponding registers (where <module> is the name of the concerned DPLLs). If the DOWNSPREAD bit is set to 1, the frequency spread on the lower side is twice the programmed value. The frequency spread on the higher side is 0.

The value of SSC_FREQ controls the rate of the generated signal. It can be programmed as a ratio of the reference clock: $f_{ref}/4$. The value that must be programmed is calculated as follows:
$ModFreqDivider = f_{ref}/(4 \times f_m)$, where $f_m < f_{ref}/70$, $f_{ref} = f_{inp}/(1+N)$, and f_{inp} is the input clock for the DPLL.
The ModFreqDivider is split into mantissa and exponent: $ModFreqDivider = Mantissa \times 2^{Exponent}$
The same value of ModFreqDivider can be obtained by different combinations of mantissa and exponent values. However, it is recommended to set the target ModFreqDivider by programming a maximum mantissa and a minimum exponent. This is controlled by the CM_SSC_MODFREQDIV_DPLL_<module>[10:8] MODFREQDIV_EXPONENT and CM_SSC_MODFREQDIV_DPLL_<module>[6:0] MODFREQDIV_MANTISSA bit fields of the corresponding registers (where <module> is the name of the concerned DPLL).
To define the modulation-frequency divider step size (ΔM) for triangular SSC, a DeltaMStep parameter must be programmed. DeltaMStep is split into integer and fractional parts. The step size can be calculated as follows:
$\Delta M = ModFreqDivider \times DeltaMStep$, if Exponent ≤3
$\Delta M = 8 \times Mantissa \times DeltaMStep$, if Exponent > 3

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

It is controlled by the CM_SSC_DELTAMSTEP_DPLL_<module>[19:0] DELTAMSTEP bit field of the corresponding register (where <module> is the name of the concerned DPLL). The CM_SSC_DELTAMSTEP_DPLL_<module>[19:18] bit field defines the integer part, while the CM_SSC_DELTAMSTEP_DPLL_<module>[17:0] bit field defines the fractional part.
The SSC_EN signal enables and disables the frequency modulation feature of the DPLL. It is controlled by the CM_CLKMODE_DPLL_<module>[12] DPLL_SSC_EN bit of the corresponding registers (where <module> is the name of the concerned DPLL).
The SSC_ACK signal notifies of the exact start and SSC end of the DPLL. It can be read by the CM_CLKMODE_DPLL_<module>[13] DPLL_SSC_ACK bit of the corresponding registers (where <module> is the name of the concerned DPLL).
The following restriction applies to the range of M values: M – ΔM should be ≥ 20. Also, M+ΔM should be ≤ 2045. If DOWNSPREAD is enabled, M – 2 × ΔM should be ≥ 20, and M ≤ 2045. In any case, the frequency modulation is programmed and it is not generally something that must be changed in real time.

describes the DPLL SSC control parameters.

Table 3-48. DPLL SSC Control Parameters

Parameter	Register	Description
SSC enable control	CM_CLKMODE_DPLL_<module>[12] DPLL_SSC_EN	Enable/disable the DPLL SSC feature. When set to disable, SSC is disabled only after completion of one full cycle of the modulation pattern to maintain the average frequency.
SSC acknowledge	CM_CLKMODE_DPLL_<module>[13] DPLL_SSC_ACK	Notifies the exact start and end of SSC
Modulation frequency divider setting (Mantissa and Exponent)	CM_SSC_MODFREQDIV_DPLL_<module>[6:0] MODFREQDIV_MANTISSA CM_SSC_MODFREEQDIV_DPLL_<module>[10:8] MODFREQDIV_EXPONENT	Set the ratio of the modulation frequency with respect to the REF_CLK/4 frequency.
M step size setting (DeltaMStepInteger and DeltaMStepFraction)	CM_SSC_DELTAMSTEP_DPLL_<module>[19:0] DELTAMSTEP	Set the feedback divider variation step-size.

3.6.3.3.5.1 Definition

The aim of the SSC is to add a variation to the frequency of an original clock, which spreads the generated interference over a larger band of frequencies.
In theory, SSC means that the clock signal is varied around the desired frequency. For example, for a 1 GHz clock, the frequency might be 999.5 MHz at one time and 1.0005 GHz at another. Doing this constantly causes the power of the tone to be spread out more over a broader band of tight frequencies (centered at the desired tone). To realize this constant variation on the original signal, a modulation with an additional signal (called spreading waveform) is realized.
Creating an SSC by spreading the initial clock frequency is done by defining the following parameters:

- The spreading frequency (deviation), which is the ratio of the range of spreading frequency over the original clock frequency
- The modulation rate (f_m), which is used to determine the clock-frequency spreading-cycling rate, and is the time during which the generated clock frequency varies through f and returns to the original frequency
- The modulation waveform, which describes the variation curve over time The spectral power reduction in the DPLL clocks is dependent on the modulation index (K), which is a ratio of spreading frequency, calculated from the frequency deviation (f) and the modulation rate (f_m).

3.6.3.3.5.2 Modulation Waveforms

The shape (profile) of the generated clock signal depends on the modulation waveform that is used during the frequency modulation. Several profiles can be used, according to the desired shaping for the energy spreading.

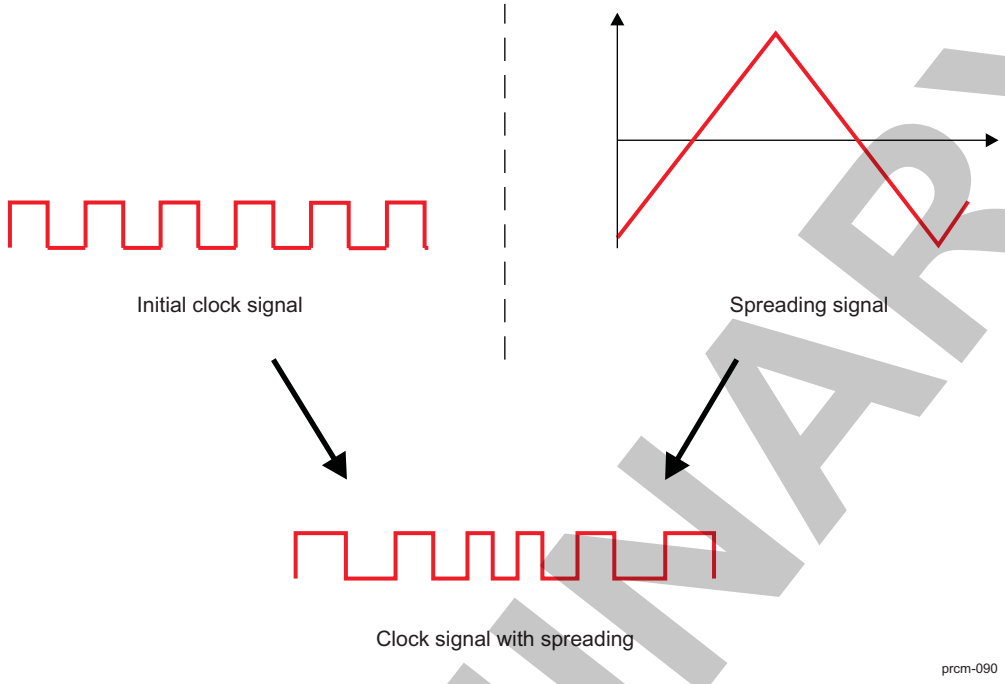
Figure 3-48. Peaks Reduction Due to Spreading



Electromagnetic interference (EMI) reduction can be estimated using the following equation:
(1) Peak_power_reduction = 10 × log ((Deviation × f_c)/f_m) – 10
Where:

- Peak_power_reduction in dB
- Deviation in percentage of the initial clock frequency (f_c), is equal to $\Delta f/f_c$
- f_c is the original clock frequency, in MHz
- f_m is the spreading frequency, in MHz

  According to equation (1), the deviation can also be calculated, and then f for a required reduction in peak-power:
  (2) Deviation = $(f_m/f_c) \times 10^{((Peak_power_reduction + 10)/10)}$
  Example:
  For f_c = 160 MHz, Deviation = 1% peak from f_c (Δf = 1.6 MHz) and f_m = 16 kHz, the estimated peak power reduction is 10 dB.

3.6.3.3.5.5 Bandwidth Calculation (Carson's Bandwidth Rule)

Carson's bandwidth rule defines the approximate bandwidth requirements of communications system components for a carrier signal that is frequency modulated by a continuous or broad spectrum of frequencies, rather than by a single frequency.

Carson's bandwidth rule is expressed by the relation CBR = 2 × (f + f_m), where CBR is the bandwidth requirement, f is the peak frequency deviation, and f_m is the highest frequency in the modulating signal. For example, an FM signal with a 5-kHz peak deviation, and a maximum audio frequency of 3 kHz, would require an approximate bandwidth 2 × (5 + 3) = 16 kHz.

Theoretically, any FM signal has an infinite number of sidebands and, hence, an infinite bandwidth. In practice, all significant sideband energy (98 percent or more) is concentrated within the bandwidth defined by Carson's bandwidth rule.

3.6.3.3.5.6 SSC Configuration

The configuration of the spreading feature is not mandatory when programming the DPLL. This feature is usually enabled when the DPLL clocks generate harmonics, which can potentially interfere with the GSM carrier frequencies.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Once the clock generation control registers are configured, the spreading on the clock signal can be configured as follows:

1. Calculate ModFreqDivider and DeltaMStep based on the desired peak-power reduction.
2. Configure the MODFREQDIV_EXPONENT, MODFREQDIV_MANTISSA, and DELTAMSTEP bit fields according to the calculated values.
3. Enable the spreading using the DPLL_SSC_EN bit.

NOTE: Spreading on a clock must be carefully configured to avoid adding noise on frequencies that are used by another module. For example, adding spreading on a clock to reduce noise on GSM frequencies can move the generated noise to the frequency of the memory controller and thus degrade its performance.

Example:
For f_c = 160 MHz, Deviation = 1% peak from f_c (Δf = 1.6 MHz) and f_m = 16 kHz, the estimated peak power reduction is 10 dB.
The output clock can be calculated using the following equation: $f_c = (f_{inp} \times M)/((N + 1) \times M2)$ (where M is a software-controlled multiplier, N is software-controlled divider, M2 is software-controlled output divider, f_c stands for f_{CLKOUT_M2}, for other output clock frequencies calculation and more information see section Section 3.6.3.3.1 *DPLLs Output Clocks Parameters* and the Clock Tree Tool).

The input clock is f_{inp} = 38.4 MHz. The following settings of the DPLL are required to have f_c = 160 MHz: M = 25, N = 2, M2 = 2. The value of M satisfies the restrictions: M – ΔM > = 20. Also, M + ΔM < = 2045.
f_{ref} can be calculated using the following equation: $f_{ref} = f_{inp}/(1 + N)$ = 12.8 MHz
ModFreqDivider can be calculated using the following equation: ModFreqDivider = $f_{ref}/(4 \times f_m)$ = 200
The exponent and mantissa of ModFreqDivider can now be calculated (where ModFreqDivider = Mantissa $\times 2^{Exponent}$ and it must be used as the minimal value for the exponent): Mantissa = 100, Exponent = 1
Knowing the deviation and M, ΔM can now be calculated: $\Delta M/M = 1\% \geq \Delta M = 0.01 \times 25 = 0.25$
DeltaMStep can be calculated as follows: DeltaMStep = ΔM/ModFreqDivider = 0.00125
The integer and fractional part of DeltaMStep can now be determined: Integer part = 0, Fractional part = $0.00125 \times 2^{18} = 327$ (for an 18-bit fractional part)
The DPLL can be configured as follows:

- MODFREQDIV_EXPONENT = 1
- MODFREQDIV_MANTISSA = 100
- DELTAMSTEP = 327

  The state of the modulation feature can be monitored with the DPLL_SSC_ACK bit of the corresponding register.

NOTE: Because this is in-band modulation for the DPLL, the modulation frequency must be within the DPLL loop bandwidth ($f_m < f_{ref}/70$). A higher modulation frequency would result in less spreading in the output clock.

When deactivating the spreading (DPLL_SSC_EN = 0), the end-of-spreading is synchronous to the internal spreading cycle. Thus, there is no residual average frequency error.

3.6.3.3.6 DPLL Output Power Down

The DCO clock LDO (DCOCLKLDO) of the DPLL can be powered down if all output dividers of the DPLL are powered down. The PRCM module automatically reenables the power to the LDO when an output divider is powered up or the DPLL switches to bypass mode.

Table 3-49. DPLL Power-Down Control Parameters

Parameter	Description
DCO clock LDO power down control	Enable/disable automatic power-down feature if all output dividers are powered down.

Modulation Frequency Divider – Mantissa	CM_SSC_MODFREQDIV_DPLL_USB[6:0] MODFREQDIV_MANTISSA

3.6.3.10 DPLLs Cascading

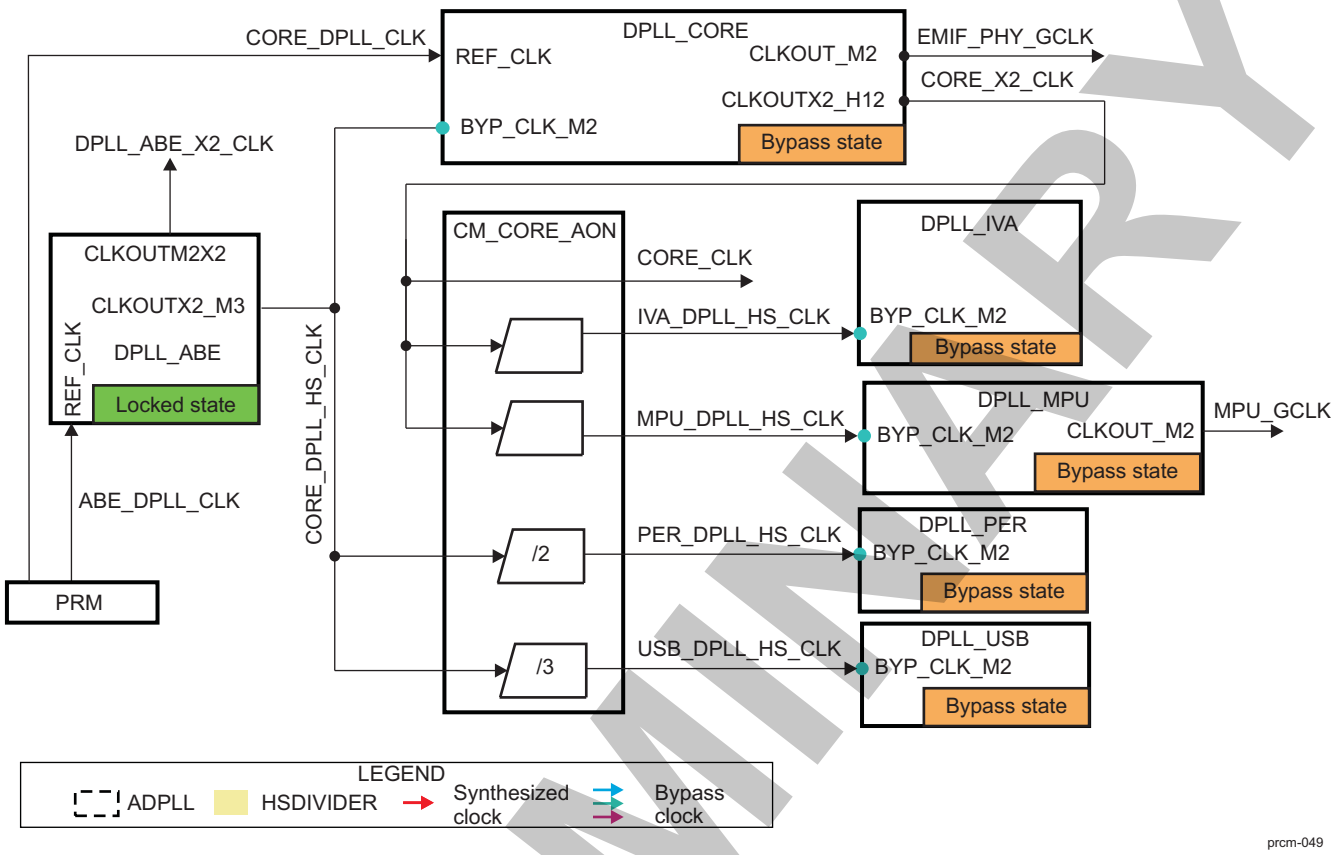
To reduce the device power consumption in certain low-power use cases of the device, the DPLLs in the device can be cascaded so that the functional clock to a power domain is provided by a DPLL upstream without locking the DPLL associated with the domain. In such a case, the unlocked DPLLs can be kept in low-power bypass mode.

Figure 3-55 shows a generic scheme for cascading DPLLs.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-55. DPLLs Cascading Overview



The sequence to enable DPLL cascading is:

1. DPLL_ABE is locked by software request. Other DPLLs downstream must not be moved to bypass mode before DPLL_ABE is locked. This ensures that the output clocks of these DPLLs are not stopped when they switch to the DPLL_ABE output clock. The ABE clock domain must be configured into SW_WKUP during DPLL cascading mode.
2. Internal EMIF shadow registers are set to take the PHY clock and DLL reference clock derived from DPLL_ABE.
3. Bypass path for DPLL_IVA is set up by configuring the programmable dividers in CM_CORE_AON that provide the bypass clock. The setting is based on the OPP requirements.
4. DPLL_IVA and DPLL_MPU are put into bypass mode by software (any of the bypass mode is allowed), and the output of the DPLLs, if already enabled, switches from locked clock to bypass clock from DPLL_CORE.
5. DPLL_PER and DPLL_USB are also put into bypass mode by software, if required. The outputs of the DPLLs, if enabled, switch to the divided clock of DPLL_ABE CLKOUTX2_M3.
6. Ensure that the CORE_CLK divider in CM_CORE_AON is programmed correctly to handle the OPP needs of the CORE power domain before this step.

   DPLL_CORE is set in bypass mode by configuring the input mux of the bypass clocks and the CM_SHADOW_FREQ_CONFIG1[10:8] DPLL_CORE_DPLL_EN bit field to bypass mode in the DVFS shadow register in CM_CORE_AON, and setting the CM_SHADOW_FREQ_CONFIG1[0] FREQ_UPDATE bit to 1 by software. This step triggers the handshake with EMIF to safely unlock the DPLL and move the output clock of DPLL_CORE to CORE_DPLL_HS_CLK.
7. Software can then switch the L4_WKUP interface clock from SYS_CLK to ABE_LP_CLK to allow for deasserting the SYS_CLK request line to SCRM, if SYS_CLK is not requested by any other dependency.

The sequence to disable the DPLL cascading is:

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

1. Software switches the L4_WKUP interface clock from ABE_LP_CLK to SYS_CLK requesting the restart of SYS_CLK by the SCRM, if not already present.
2. Software programs the EMIF internal shadow registers to prepare the switchback of EMIF from using the DPLL_ABE clock to the DPLL_CORE clock.
3. DPLL_IVA/DPLL_MPU bypass path is correctly set for the targeted DPLL_CORE frequency by programming the bypass dividers for the DPLL in CM_CORE_AON.
4. DPLL_CORE is relocked using the DVFS shadow register in CM_CORE_AON. The PRCM module ensures that this step is executed with proper handshake with EMIF to allow for a frequency update on the EMIF.
5. Other DPLLs are also locked, if required, to exit completely from DPLL cascading mode.
6. DPLL_ABE may be forced into STOPMODE or bypass mode by software or may enter one of the auto modes if so programmed.

NOTE: The DPLLs cascading is useful in MP3 playback use case, while using the SYS_32K clock only, and SYS_CLK is gated.

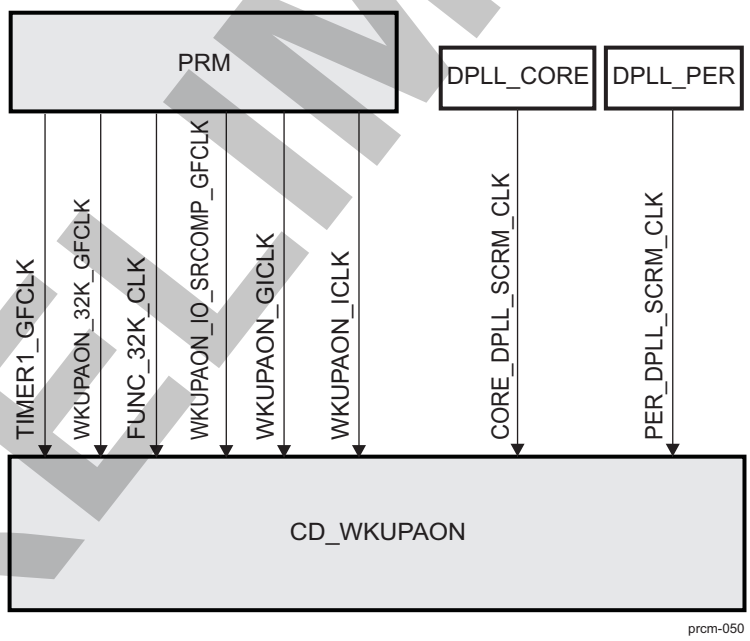
3.6.4 CD_WKUPAON Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.1 Overview

Figure 3-56 is an overview of the clock domain.

Figure 3-56. CD_WKUPAON Overview



3.6.4.2 Specific properties and signals.

PRCM provides WKUPAON_IO_SRCOMP_PWRDN signal to the smart IO compensation cell part of WKUP voltage domain. This signal is fully controlled by HW. After power on reset, SW has to enable IO slew rate compensation cell clock by setting CM_WKUPAON_IO_SRCOMP_CLKCTRL[8] CLKEN_SRCOMP_FCLK. PRCM enables WKUPAON_IO_SRCOMP_GFCLK clock and de-assert WKUPAON_IO_SRCOMP_PWRDN signal.

Before device transition to low power state, PRCM:

Copyright © 2013, Texas Instruments Incorporated

PRELIMINARY

1. Asserts WKUPAON_IO_SRCOMP_PWRDN signal first.
2. Wait for 8 SYS_CLK cycles.
3. Gates WKUPAON_IO_SRCOMP_GFCLK clock.

When device wakes-up from low power state, PRCM enables automatically WKUPAON_IO_SRCOMP_GFCLK clock and de-asserts WKUPAON_IO_SRCOMP_PWRDN signal.

NOTE:

1. By clearing CM_WKUPAON_IO_SRCOMP_CLKCTRL[8] CLKEN_SRCOMP_FCLK bitfield can disable WKUPAON_IO_SRCOMP_GFCLK clock and set WKUPAON_IO_SRCOMP_PWRDN signal.
2. For low power cases, to allow gating of SYS_CLK, it has to disable WKUPAON_IO_SRCOMP_GFCLK clock.

3.6.4.3 Clock Domain Modes

Table 3-85 lists the clock domain modes supported by the clock domain.

Table 3-85. CD_WKUPAON Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-86 lists the clock domain state transition control and status bits for the clock in this clock domain

Table 3-86. CD_WKUPAON Control and Status Parameters

Parameter Name	Control/Status Bit Field
ABE_LP_CLK Clock Status	CM_WKUPAON_CLKSTCTRL[9] CLKACTIVITY_ABE_LP_CLK
WKUPAON_GICLK Clock Status	CM_WKUPAON_CLKSTCTRL[12] CLKACTIVITY_WKUPAON_GICLK
SYS_CLK Clock Status; includes profiling EMU_SYS_CLK and all functional SYS_CLK	CM_WKUPAON_CLKSTCTRL[8] CLKACTIVITY_SYS_CLK
SYS_CLK Status when running at SCRM level	CM_WKUPAON_CLKSTCTRL[15] CLKACTIVITY_SYS_CLK_ALL
SYS_CLK Clock Status of functional branches, exclude activity of the EMU_SYS_GCLK clock	CM_WKUPAON_CLKSTCTRL[14] CLKACTIVITY_SYS_CLK_FUNC
WKUPAON_32K_GFCLK Clock Status	CM_WKUPAON_CLKSTCTRL[11] CLKACTIVITY_WKUPAON_32K_GFCLK

CD_EMIF	Always enabled	CM_MPU_DYNAMICDEP[4] EMIF_DYNDEP	Read only

3.6.7.4 Clock Domain Module Attributes

Table 3-110 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-110. CD_MPU Modules Clocks Association

Module	Clock	Clock Type
MPU	MPU_GCLK	Interface and functional

Table 3-111 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-111. CD_MPU Modules Wake-Up Request

Module	Wake-Up Feature
MPU	Master wake-up request

Table 3-112 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-112. CD_MPU Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
MPU	Master/slave	CM_MPU_MPU_CLKCTRL[18] STBYST	Standby status
		CM_MPU_MPU_CLKCTRL[17:16] IDLEST	Idle status

Table 3-113 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-113. CD_MPU Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
MPU	N/A	Available	N/A	CM_MPU_MPU_CLKCTRL[1:0] MODULEMODE	Read only

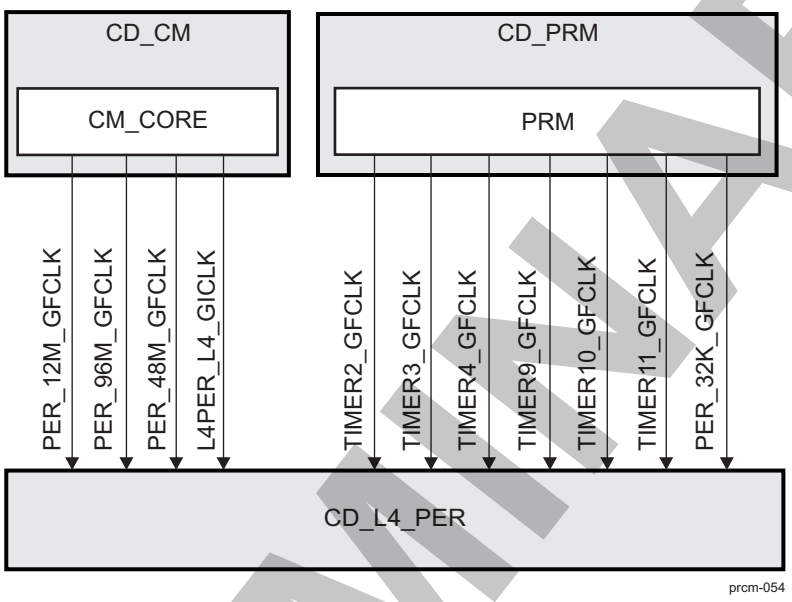
3.6.8 CD_L4_PER Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.8.1 Overview

Figure 3-60 is an overview of the clock domain.

Figure 3-60. CD_L4_PER Overview



3.6.8.2 Clock Domain Modes

Table 3-114 lists the clock domain modes supported by the clock domain.

Table 3-114. CD_L4_PER Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-115 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-115. CD_L4_PER Control and Status Parameters

Parameter Name	Control/Status Bit Field
TIMER10_GFCLK clock status	CM_L4PER_CLKSTCTRL[9] CLKACTIVITY_TIMER10_GFCLK
TIMER11_GFCLK clock status	CM_L4PER_CLKSTCTRL[10] CLKACTIVITY_TIMER11_GFCLK
TIMER2_GFCLK clock status	CM_L4PER_CLKSTCTRL[11] CLKACTIVITY_TIMER2_GFCLK
TIMER3_GFCLK clock status	CM_L4PER_CLKSTCTRL[12] CLKACTIVITY_TIMER3_GFCLK
TIMER4_GFCLK clock status	CM_L4PER_CLKSTCTRL[13] CLKACTIVITY_TIMER4_GFCLK
TIMER9_GFCLK clock status	CM_L4PER_CLKSTCTRL[14] CLKACTIVITY_TIMER9_GFCLK
L4PER_L4_GICLK clock status	CM_L4PER_CLKSTCTRL[8] CLKACTIVITY_L4PER_L4_GICLK
PER_12M_GFCLK clock status	CM_L4PER_CLKSTCTRL[15] CLKACTIVITY_PER_12M_GFCLK
PER_32K_GFCLK clock status	CM_L4PER_CLKSTCTRL[17] CLKACTIVITY_PER_32K_GFCLK
PER_48M_GFCLK clock status	CM_L4PER_CLKSTCTRL[18] CLKACTIVITY_PER_48M_GFCLK

Table 3-115. CD_L4_PER Control and Status Parameters (continued)

Parameter Name	Control/Status Bit Field
PER_96M_GFCLK clock status	CM_L4PER_CLKSTCTRL[19] CLKACTIVITY_PER_96M_GFCLK
Clock Domain State Transition Control	CM_L4PER_CLKSTCTRL[1:0] CLKTRCTRL

3.6.8.3 Clock Domain Dependency

CD_L4_PER has no static dependency with any other clock domain of the device.

3.6.8.3.1 Dynamic Dependency

Table 3-116 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-116. CD_L4_PER Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4_SEC	Always enabled	CM_L4PER_DYNAMICDEP[14] L4SEC_DYNDEP	Read only
CD_DSS	Always enabled	CM_L4PER_DYNAMICDEP[8] DSS_DYNDEP	Read only
CD_L3INIT	Always enabled	CM_L4PER_DYNAMICDEP[7] L3INIT_DYNDEP	Read only

3.6.8.3.2 Wake-Up Dependency

Table 3-117 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-117. CD_L4_PER Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
TIMER10	CD_L4_PER	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Enabled	PM_L4PER_TIMER10_WKDEP[0] WKUPDEP_TIMER10_MPU	Read/write
TIMER11	CD_L4_PER	CD_IPU, CD_L3_MAIN2	Disabled	PM_L4PER_TIMER11_WKDEP[1] WKUPDEP_TIMER11_IPU	Read/write
TIMER11	CD_L4_PER	CD_MPU, CD_L3_MAIN1, CD_L3_MAIN2	Disabled	PM_L4PER_TIMER11_WKDEP[0] WKUPDEP_TIMER11_MPU	Read/write

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Not available	Not available	Not available	Available

Table 3-176 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-176. CD_L3_INSTR Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3INSTR_L3_GICLK Clock Status	CM_L3INSTR_CLKSTCTRL[8] CLKACTIVITY_L3INSTR_L3_GICLK
L3INSTR_DLL_AGING_GCLK Clock Status	CM_L3INSTR_CLKSTCTRL[9] CLKACTIVITY_L3INSTR_DLL_AGING_GCLK
L3INSTR_TS_GCLK Clock Status	CM_L3INSTR_CLKSTCTRL[10] CLKACTIVITY_L3INSTR_TS_GCLK
Clock Domain State Transition Control	CM_L3INSTR_CLKSTCTRL[1:0] CLKTRCTRL

3.6.16.3 Clock Domain Dependency

CD_L3_INSTR has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

For aging, DLL requires a low-frequency clock that must run as long as the CORE power domain is on. To match this requirement, the DLL_AGING module has been created and instantiated in this clock domain, which is the last to transition in low-power state.

3.6.16.4 Clock Domain Module Attributes

Table 3-177 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

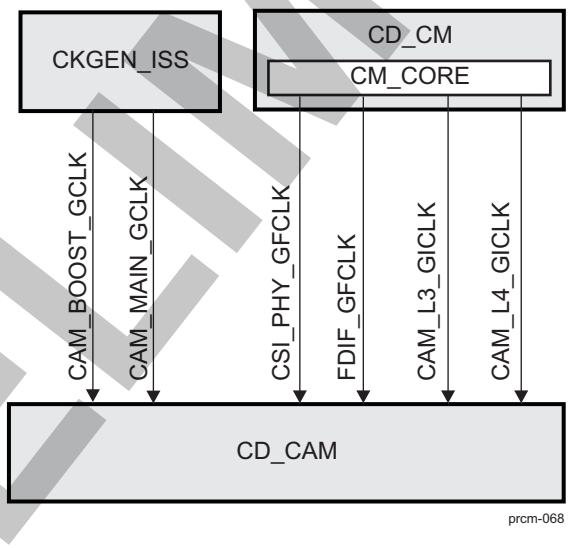
3.6.22 CD_CAM Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.22.1 Overview

Figure 3-74 is an overview of the clock domain.

Figure 3-74. CD_CAM Overview



The CKGEN_ISS (clock generator) is not part of the PRCM module. It is in the ISS.

3.6.22.2 Clock Domain Modes

Table 3-217 lists the clock domain modes supported by the clock domain.

Table 3-217. CD_CAM Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-218 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-218. CD_CAM Control and Status Parameters

Parameter Name	Control/Status Bit Field
CSI_PHY_GFCLK Clock Status	CM_CAM_CLKSTCTRL[9] CLKACTIVITY_CSI_PHY_GFCLK
CSI_PHY_GFCLK Clock Control	CM_CAM_ISS_CLKCTRL[8] OPTFCLKEN_CTRLCLK
FDIF_GFCLK Clock Status	CM_CAM_CLKSTCTRL[10] CLKACTIVITY_FDIF_GCLK
FDIF_GFCLK Clock Control	CM_CAM_FDIF_CLKCTRL[24] CLKSEL_FCLK
CAM_MAIN_GCLK Clock Status	CM_CAM_CLKSTCTRL[8] CLKACTIVITY_CAM_GCLK
CAM_L3_GICLK Clock Status	CM_CAM_CLKSTCTRL[12] CLKACTIVITY_CAM_L3_GICLK
CAM_BOOST_GCLK Clock Status	CM_CAM_CLKSTCTRL[11] CLKACTIVITY_CAM_BOOST_GCLK
Clock Domain State Transition Control	CM_CAM_CLKSTCTRL[1:0] CLKTRCTRL

3.6.22.3 Clock Domain Dependency

CD_CAM has no module wake-up dependency with any other clock domain of the device.

3.6.22.3.1 Static Dependency

Table 3-219 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-219. CD_CAM Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVA	Disabled	CM_CAM_STATICDEP[2] IVA_STATDEP	Read/write
CD_L3_MAIN1	Disabled	CM_CAM_STATICDEP[5] L3MAIN1_STATDEP	Read/write
CD_L3_MAIN2	Always enabled	CM_CAM_STATICDEP[6] L3MAIN2_STATDEP	Read only
CD_EMIF	Disabled	CM_CAM_STATICDEP[4] EMIF_STATDEP	Read/write

3.6.22.3.2 Dynamic Dependency

Table 3-220 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-220. CD_CAM Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_MAIN2	Alway disabled	CM_CAM_DYNAMICDEP[6] L3MAIN2_DYNDEP	Read only

3.6.22.4 Clock Domain Module Attributes

Table 3-221 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

Table 3-221. CD_CAM Modules Clocks Association

Module	Clock	Clock Type
FDIF	FDIF_GCLK	Interface and functional
ISS	CAM_BOOST_GCLK	Functional

3.7 Power Management Functional Description

This section describes the functional concepts of power management at the power domain level in the device.

The following power domains support dynamic power switching (DPS) with switching times of less than 5 µs.

- PD_CORE
- PD_DSP
- PD_MPU

For these three power domains, the "SWITCH_LOOPBACK" parameter of corresponding PSCON must be chosen correctly in order to allow loop-back of PONOUT to PGOODIN.

For other power domains, the "SWITCH_LOOPBACK" parameter will be chosen in the other way. A 10µs delay will be included by PSCON between PONIN and PGOODIN.

3.7.1 PD_WKUPAON Description

PD_WKUPAON contains the following reset domains:

- WKUPAON_PWRON_RST
- WKUPAON_RST
- WKUPAON_SYS_PWRON_RST
- PRM_PWRON_RST
- PRM_RST
- LPRM_PWRON_RST
- LPRM_RST

PD_WKUPAON contains the CD_WKUPAON clock domain.

Table 3-239 lists the logic retention capability for each module of the power domain.

Table 3-239. PD_WKUPAON Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CTRL_MODULE_WKUP	No	None	None
GPIO1	No	RM_WKUPAON_GPIO1_CONTEXT[0] LOSTCONTEXT_DFF	None
KBD	No	RM_WKUPAON_KBD_CONTEXT[0] LOSTCONTEXT_DFF	None
PRCM_MPU	No	None	None
SAR_RAM	No	RM_WKUPAON_SAR_RAM_CONTEXT[0] LOSTCONTEXT_DFF	None
SCRM	No	None	None

3.7.1.1 Power Domain Modes

The PD_WKUPAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD_WKUPAON power domain has one memory bank, sar_bank, which is related to SAR_RAM.

3.7.1.1.1 Logic and Memory Area Power Modes

Table 3-240 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-240. PD_WKUPAON Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
WKUP_BANK		ON		

3.7.2 PD_DSP Description

PD_DSP contains the following reset domains:

- DSP_RST
- DSP_PWRON_RST
- DSP_RET_RST
- DSP_SYS_RST

PD_DSP contains the CD_DSP clock domain.

Table 3-241 lists the logic retention capability for each module of the power domain.

Table 3-241. PD_DSP Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DSP	Partial	RM_DSP_DSP_CONTEXT[0] LOSTCONTEXT_DFF	RM_DSP_DSP_CONTEXT[1] LOSTCONTEXT_RFF

3.7.2.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.2.1.1 Logic and Memory Area Power Modes

Table 3-242 lists the power modes supported by the logic area of the power domain.

Table 3-242. PD_DSP Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Available	Available	Available

Table 3-243 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-243. PD_DSP Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
DSP_DMA		ON	RETENTION
	DSP – DSP_DMA	always_on	always_retention
DSP_L1		ON	RETENTION
	DSP – DSP_L1	always_on	software_control
DSP_L2		ON	RETENTION
	DSP – DSP_L2	always_on	software_control

3.7.2.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-244 lists the power mode controls for the power domain.

Table 3-244. PD_DSP Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	DSP_L2	PM_DSP_PWRSTCTRL[9] DSP_L2_RETSTATE	Read/write
Memory Area – State Control (logic in RETENTION state)	DSP_L1	PM_DSP_PWRSTCTRL[8] DSP_L1_RETSTATE	Read/write
Power Domain – Low-Power State Change Control		PM_DSP_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Memory Area – State Control (logic in ON state)	DSP_DMA	PM_DSP_PWRSTCTRL[21:20] DSP_EDMA_ONSTATE	Read only
Logic Area – Retention State Control		PM_DSP_PWRSTCTRL[2] LOGICRETSTATE	Read/write
Memory Area – State Control (logic in ON state)	DSP_L2	PM_DSP_PWRSTCTRL[19:18] DSP_L2_ONSTATE	Read only
Memory Area – State Control (logic in ON state)	DSP_L1	PM_DSP_PWRSTCTRL[17:16] DSP_L1_ONSTATE	Read only
Memory Area – State Control (logic in RETENTION state)	DSP_EDMA	PM_DSP_PWRSTCTRL[10] DSP_EDMA_RETSTATE	Read only
Power Domain – State Transition Control		PM_DSP_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-245 lists the power mode status for the power domain.

Table 3-245. PD_DSP Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_DSP_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	DSP_EDMA	PM_DSP_PWRSTST[9:8] DSP_EDMA_STATEST
Memory Area – State Status	DSP_L2	PM_DSP_PWRSTST[7:6] DSP_L2_STATEST
Memory Area – State Status	DSP_L1	PM_DSP_PWRSTST[5:4] DSP_L1_STATEST
Power Domain – State Transition Status		PM_DSP_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_DSP_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_DSP_PWRSTST[1:0] POWERSTATEST

3.7.3 PD_CUSTEFUSE Description

PD_CUSTEFUSE contains the following reset domains:

- CUSTEFUSE_RST

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

PD_CUSTEFUSE contains the CD_CUSTEFUSE clock domain.

Table 3-241 lists the logic retention capability for each module of the power domain.

Table 3-246. PD_CUSTEFUSE Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
EFUSE_CTRL_CUST	No	RM_CUSTEFUSE_EFUSE_CTRL_CUST_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.3.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.3.1.1 Logic and Memory Area Power Modes

Table 3-242 lists the power modes supported by the logic area of the power domain.

Table 3-247. PD_CUSTEFUSE Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
N/A	Available	Available

Table 3-243 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

There is no memory bank implemented for the PD_CUSTEFUSE.

3.7.3.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-244 lists the power mode controls for the power domain.

Table 3-248. PD_CUSTEFUSE Power Modes Control Parameters

Parameter Name	Control Bit Field	Access Type
Power Domain – Low-Power State Change Control	PM_CUSTEFUSE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Power Domain – State Transition Control	PM_CUSTEFUSE_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-245 lists the power mode status for the power domain.

3.7.4 PD_MPU Description

PD_MPU contains the following reset domains:

- MPU_PWRON_RST
- MPU_RST
- MPU_MA_RST
- MPU_MA_RET_RST
- MPU_MA_PWRON_RET_RST

PD_MPU contains the CD_MPU clock domain.

Table 3-250 lists the logic retention capability for each module of the power domain.

Table 3-250. PD_MPU Module Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
MPU	Partial	RM_MPU_MPU_CONTEXT[0] LOSTCONTEXT_DFF	RM_MPU_MPU_CONTEXT[1] LOSTCONTEXT_RFF

3.7.4.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.4.1.1 Logic and Memory Area Power Modes

Table 3-251 lists the power modes supported by the logic area of the power domain.

Table 3-251. PD_MPU Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Available	Available	Available

Table 3-252 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-252. PD_MPU Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
MPU_L2		ON	RETENTION
	MPU – MPU_L2	always_on	software_control
MPU_RAM		ON	RETENTION
	MPU - MPU_RAM	always_on	software_control

3.7.4.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-253 lists the power mode controls for the power domain.

Table 3-253. PD_MPU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	MPU_L2	PM_MPU_PWRSTCTRL[9] MPU_L2_RETSTATE	Read/write

Table 3-254. PD_MPU Power Mode Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain – Last Power State Entered Status		PM_MPU_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area – State Status	MPU_L2	PM_MPU_PWRSTST[7:6] MPU_L2_STATEST
Memory Area – State Status	MPU_RAM	PM_MPU_PWRSTST[9:8] MPU_RAM_STATEST
Power Domain – State Transition Status		PM_MPU_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_MPU_PWRSTST[2] LOGICSTATEST
Power Domain – State Status		PM_MPU_PWRSTST[1:0] POWERSTATEST

3.7.4.1.3 Power State Override

The PRCM module controls the power state of the MPU subsystem, whereas the PRCM_MPU controls the power state of each CPU (CPU0 and CPU1). The MPU subsystem requires that the MPU power domain can transition only to a low-power mode when CPU0 and CPU1 are in a lower power mode than is specified in the PM_MPU_PWRSTCTRL register. The power mode of the CPUs is communicated to the PRCM module by the PRCM_MPU through two dedicated internal signals. These two signals specify the lowest power state that the MPU can enter and, if necessary, override the low-power state programmed in the PM_MPU_PWRSTCTRL register.

Table 3-255 lists the low-power modes allowed by the MPU.

Table 3-255. MPU Allowed Low-Power Mode

MPU Allowed Low-Power Mode	Comment
CSWRET	CPUs are in SR3-APG mode and L1$ is in RETENTION state.
INACTIVE	CPUs are in SR3-APG mode and L1$ is in ON state, or CPUs are in INACTIVE state.
ON	CPUs are in ON state.

If PM_MPU_PWRSTCTRL is programmed to a lower power state than allowed (specified by the two signals), then it is overwritten by the hardware. The valued of the PM_MPU_PWRSTCTRL register is not changed (that is, not overwritten).

MPU subsystem guaranties that MPU_LP_ALLOWED[1:0] signals are steady before MPU subsystem STANDBY is asserted.

3.7.5 PD_L3INIT Description

PD_L3INIT contains the following reset domains:

Copyright © 2013, Texas Instruments Incorporated

PRELIMINARY

- DPLL_L3INIT_PWRON_RET_RST
- L3INIT_PWRON_RST
- L3INIT_RET_RST
- L3INIT_RST

PD_L3INIT contains the CD_L3INIT clock domain.

Table 3-256 lists the logic retention capability for each module of the power domain.

Table 3-256. PD_L3INIT Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status

3.7.9.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.9.1.1 Logic and Memory Area Power Modes

Table 3-277 lists the power modes supported by the logic area of the power domain.

Table 3-277. PD_DSS Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
N/A	Available	Available

Table 3-278 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-278. PD_DSS Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
DSS_MEM		ON	
	DSS – DSSMEM	always_on	always_off
	BB2D - BB2D_MEM	always_on	always_off

3.7.9.1.2 Logic and Memory Area Power Mode Control and Status

Table 3-279 lists the power modes controls for the power domain.

Table 3-279. PD_DSS Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area – State Control (logic in RETENTION state)	DSS_MEM	PM_DSS_PWRSTCTRL[8] DSS_MEM_RETSTATE	Read only
Power Domain – Low-Power State Change Control		PM_DSS_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/write
Logic Area – RETENTION State Control		PM_DSS_PWRSTCTRL[2] LOGICRETSTATE	Read only
Memory Area – State Control (logic in ON state)	DSS_MEM	PM_DSS_PWRSTCTRL[17:16] DSS_MEM_ONSTATE	Read only
Power Domain – State Transition Control		PM_DSS_PWRSTCTRL[1:0] POWERSTATE	Read/write

Table 3-280 lists the status of the power modes for the power domain.

Table 3-280. PD_DSS Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area – State Status	DSS_MEM	PM_DSS_PWRSTST[5:4] DSS_MEM_STATEST
Power Domain – Last Low Power State Entered Status		PM_DSS_PWRSTST[25:24] LASTPOWERSTATEENTERED
Power Domain – State Transition Status		PM_DSS_PWRSTST[20] INTRANSITION
Logic Area – State Status		PM_DSS_PWRSTST[2] LOGICSTATEST
Power Domain – Current Power State Status		PM_DSS_PWRSTST[1:0] POWERSTATEST

3.7.10 PD_CORE Description

PD_CORE contains the following reset domains:

- CM_CORE_PWRON_RET_RST
- CM_CORE_RET_RST
- CORE_PWRON_RET_RST
- CORE_PWRON_RST
- CORE_RET_RST
- CORE_RST
- DLL_RST
- IPU_PWRON_RST
- IPU_RET_RST
- IPU_CPU0_RST
- IPU_CPU1_RST
- IPU_RST
- EMIF_DDR_PHY_PWRON_RST
- DMA_RET_RST

PD_CORE contains the following clock domains:

- CD_DMA
- CD_IPU
- CD_EMIF
- CD_L3_MAIN1
- CD_L3_MAIN2
- CD_L3_INSTR

3.7.10.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see Section 3.1.1.2.1, *Power Domain*.

3.7.10.1.1 Logic and Memory Area Power Modes

Table 3-282 lists the power modes supported by the logic area of the power domain.

Table 3-282. PD_CORE Logic Area Power Modes

Retention-CSWR	On-Inactive	On-Active
Available	Available	Available

Table 3-283 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On and Logic Retention columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Table 3-283. PD_CORE Memory Area Power Modes

Memory Bank	Module – Memory	Logic On	Logic Retention
CORE_NRET_BANK		ON	
	DMM – DMM_MEMBANK2	always_on	always_off
	OCP_WP_NOC – OCPWP_BANK	always_on	always_off
	MMC3 - MMC_RAM	always_on	always_off
	MMC4 - MMC_RAM	always_on	always_off
	MMC5 - MMC_RAM	always_on	always_off
	FPKA - pka_mem	always_on	always_off
CORE_OCMRAM		ON	RETENTION

3.8 Voltage-Management Functional Description

This section describes the voltage domains and voltage control architecture. It also explains the interactions between the device and the external power IC.

3.8.1 Overview

The voltage-management architecture of the device is based on voltage sources managed by the PRCM module. They define the voltage domains within the device (see Section 3.1.1.3, *Voltage Management*). This partition of the voltage domains ensures independent voltage control of each voltage domain through dedicated SMPS or LDO. The following voltage domains are managed by the PRCM module:

- VDD_CORE_L
- VDD_MPU_L
- VDD_MM_L
- VDD_WKUP_L
- VDD_CORE_M
- VDD_MM_M
- VDD_MPU_M
- VDD_MM_ABB
- VDD_MPU_ABB

NOTE: For the association of the device power supply pin to the power domain, see Table 3-27.

The PRCM module supports the AVS technique on the VDD_MPU_L, VDD_CORE_L, and VDD_MM_L voltage domains through automatic monitoring and adjustments of voltages by their dedicated SmartReflex modules. The VDD_MPU_L voltage domain supports four DVFS OPPs. The VDD_MM_L and VDD_WKUP_L voltage domains support three DVFS OPPs. The VDD_CORE_L voltage domain supports two DVFS OPPs.

The PRCM module also supports the ABB technique on the MPU and MM voltage domains through the VDD_MPU_ABB and VDD_MM_ABB biasing voltages.

The PRCM module automatically scales down VDD_MPU_M, VDD_CORE_M, and VDD_MM_M to retention voltage level whenever all memory banks on these domains transition to the RETENTION power state.

Table 3-299 lists the supported DVFS OPPs for each voltage domain. The exact values depend on the silicon; for more information, see the Data Manual Operating Condition addendum.

Table 3-299. Supported DVFS OPPs Summary

Voltage Domain	Operating Point	Control
VDD_MPU_L (VD_MPU)	RETENTION OPP_LOW OPP_NOM OPP_HIGH OPP_SPEEDBIN	Hardware and software
VDD_MM_L (VD_MM)	RETENTION OPP_LOW OPP_NOM OPP_OD	Hardware and software
VDD_CORE_L (VD_CORE)	RETENTION OPP_NOM	Hardware and software
VDD_WKUP_L (VD_WKUP)	RETENTION OPP_WKUP_ACTIVE OPP_WKUP_EMULATION	Hardware and software

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Table 3-299. Supported DVFS OPPs Summary (continued)

Voltage Domain	Operating Point	Control
	OPP_WKUP_SLEEP	

At boot time, the device is set with all two voltage domains (VDD_MPU_L, VDD_MM_L) at OPP_LOW.

VDD_MPU_L (MPU voltage domain) voltage state status can be checked by reading bitfield PRM_VOLTST_MPU[1:0] VOLTSTATEST.

VDD_MM_L (MM voltage domain) voltage state status can be checked by reading bitfield PRM_VOLTST_MM[1:0] VOLTSTATEST.

DVFS OPPs dependencies:

For detailed information about DVFS OPPs dependencies, see the *Data Manual Operating Condition Addendum*.

Other OPPs limitations:

- When exiting from off (no power source) mode, voltage values for MPU, MM domains must be at OPP_LOW.

3.8.2 Voltage-Control Architecture

The PRM is split over several blocks that manage the different voltage sources.

- Voltage processors for converting SmartReflex data to voltage values before sending to the voltage controller
- Voltage FSMs for managing VDD_MPU_L, VDD_MM_L voltages (hardware control of voltages). They send commands to the voltage controller (I^2C mode).
- A voltage controller for gathering commands from the PRCM module register (direct access), voltage processors, and voltage FSMs. It then handles communication with the external power IC through the dedicated I^2C interface.
- A device FSM for managing the voltage FSMs and I/O wake-up control and system clock control sequencing during device sleep and wake-up transitions
- LDO regulator controllers for ABB management, memory array voltage management, and wake-up logic.
- BANDGAPs reference voltage sleep control

NOTE: The SmartReflex module allows dynamic voltage adjustments around an OPP voltage level to ensure target performance. It also allows switching from one OPP to another. However, it does not control voltage switching of the voltage domain to RETENTION level when all power domains within the power domain are in RETENTION power state. This is handled by the voltage FSMs.

Figure 3-77 shows the architecture for PRM voltage control.

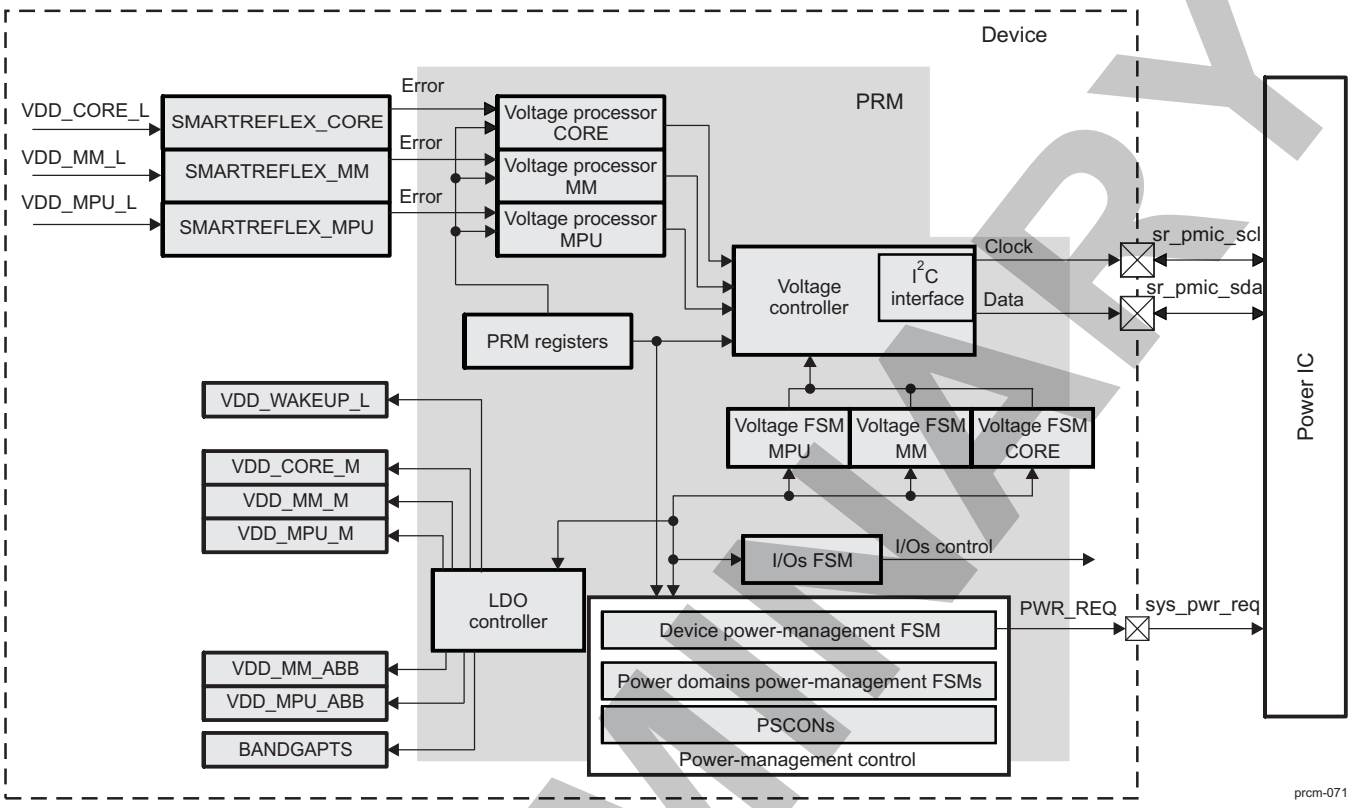
Figure 3-77. PRM Voltage Control Architecture



3.8.3 VDD_MPU_L, VDD_CORE_L, and VDD_MM_L Control

These power supply sources can be controlled using PRM dedicated I²C control.

3.8.3.1 PRM Dedicated I²C Control

The PRM I²C interface is dedicated to SmartReflex voltage control. It enables the voltage controller to send voltage commands to the external power IC. To reduce latency of voltage changes, the voltage controller is configurable to run in HS I²C mode. The PRM I²C interface supports multimaster mode.

The voltage controller receives voltage control commands from the following input ports:

- Voltage processors ports: Each voltage processor sends voltage change commands to the voltage controller depending on the information received from the associated SmartReflex module.
- Voltage PRCM ports: Each voltage PRCM sends commands to the voltage controller when the device enters RETENTION or off (no power supply) power state, and also when the device wakes up.
- PRM register port: The PRM registers give direct software control over the voltage levels of the external voltage sources.

An arbitration scheme in the voltage controller manages concurrent requests on different ports.

Each internal port has a handshake to indicate when the I²C frame that results from the request on that port is acknowledged by the external power IC.

The PRM can also send external voltage source sleep commands that can be used to activate power IC sleep mode, where the voltage regulator maintains output voltage but only a small load is supported. This also lets the external power IC reduce its power consumption.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

NOTE: An I^2C interface not controlled by the PRM can be used to program the voltage levels of the external power IC. Because the I^2C interface is not a hardware-controlled interface, its use is restricted to moving the voltage level from one OPP to another.

In this case, the control software must operate the voltage transition when device activity allows one.

3.8.3.2 Adaptive Voltage Scaling

As explained in Section 3.1.2.4, *Adaptive Voltage Scaling*, the SmartReflex technology uses adaptive power supply to reduce active power consumption. With SmartReflex, the power supply voltage can be adapted to the silicon performance statically (for example, adapted to the manufacturing process of a given device) or dynamically (for example, adapted to the temperature-induced current performance of the device).

SmartReflex voltage control in the device is based on the dedicated SmartReflex modules and the voltage processors, in addition to the voltage controller with a dedicated I^2C interface, which are shared with the voltage PRCM modules and voltage control registers.

The SmartReflex modules allow a continuous real-time monitoring of the voltage supply and device performance to:

- Minimize the supply voltage to reduce the device power consumption
- Maintain the desired device performance (by dynamically adjusting the device voltage) as the temperature of the device varies

Because the SmartReflex modules and the voltage processors are dedicated to SmartReflex voltage control, they are described together in this section.

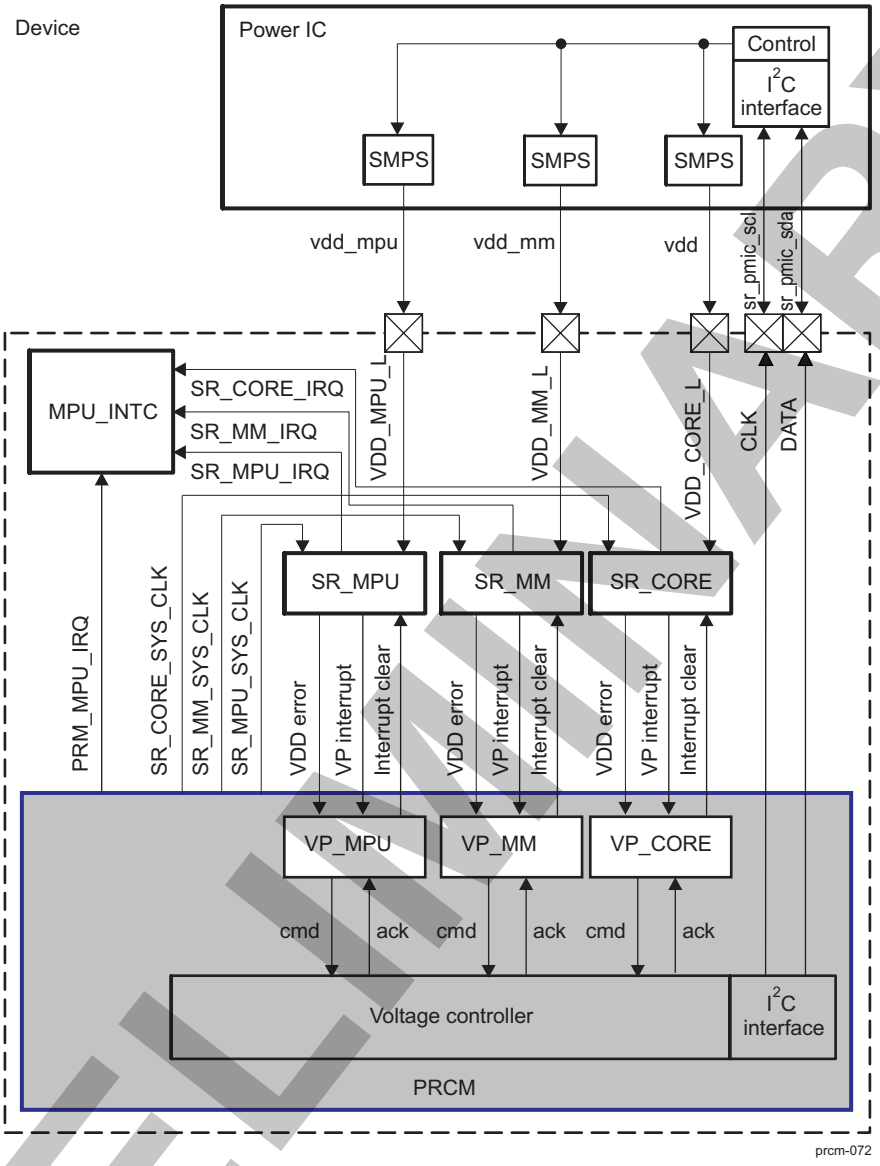
3.8.3.2.1 SmartReflex in the Device

Figure 3-78 shows the SmartReflex integration.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Figure 3-78. SmartReflex Integration



SmartReflex voltage control in the device is implemented for simultaneous control of three independent voltage sources. One SmartReflex module controls the VDD_CORE_L voltage, the second one is dedicated to VDD_MM_L control, and the third controls the VDD_MPU_L voltage. Each SmartReflex module is connected to a voltage processor. Voltage commands from all voltage processors are passed to a voltage control, which sends them through a dedicated I^2C master interface to the power IC.

SmartReflex modules are in the PD_COREAON power domain and supplied by the VDD_CORE_L voltage domain. Each module senses its own voltage domain (VDD_CORE_L, VDD_MM_L, or VDD_MPU_L).

3.8.3.2.2 SmartReflex Module

Figure 3-79 is a functional overview of the SmartReflex module.

PRELIMINARY

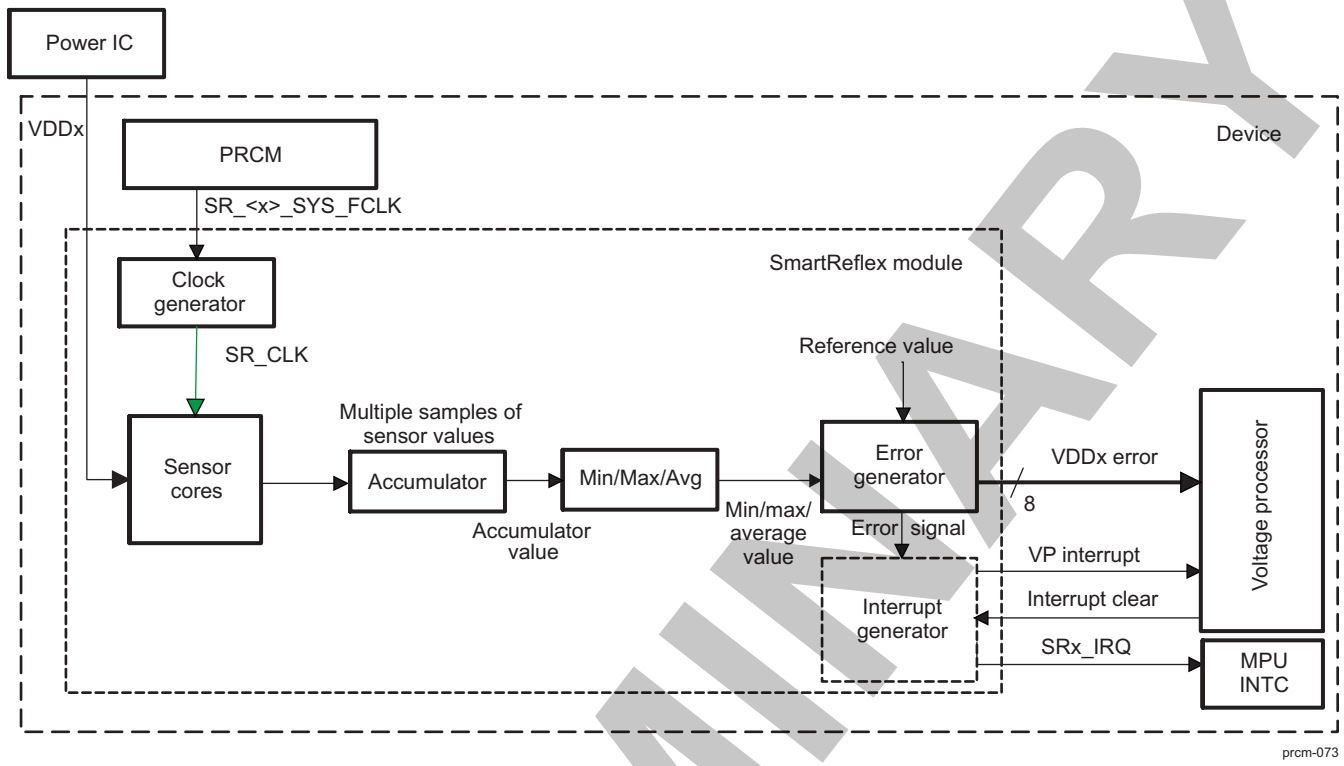
Figure 3-79. SmartReflex Module Functional Overview



3.8.3.2.3 SmartReflex Submodules

NOTE: In this and the following section, SMARTREFLEXn refers to the SMARTREFLEX_MM, SMARTREFLEX_MPU, and SMARTREFLEX_CORE SmartReflex modules.

The SmartReflex module is enabled by setting the SMARTREFLEXn.SRCONFIG[11] SRENABLE bit. The SmartReflex module is composed of six blocks:

- Clock generator
- Sensor core
- Accumulator
- Minimum/maximum/average
- Error generator
- Interrupt generator

Clock Generator

The clock generator provides the internal SMARTREFLEX_CLK sampling clock to the sensor core of the module. The SMARTREFLEXn.SRCONFIG[21:12] SRCLKLENGTH bit field allows the setting of the frequency divider ratio between SMARTREFLEXn_SYS_CLK and the SMARTREFLEX_CLK. It is calculated using Equation 1:

$$\text{SMARTREFLEXn.SRCONFIG[21:12] SRCLKLENGTH} = f_{\text{SMARTREFLEXn_SYS_CLK}} / (2 * f_{\text{SMARTREFLEX_CLK}}) \quad (1)$$

Where $f_{\text{SMARTREFLEXn_SYS_CLK}}$ is the frequency of the SMARTREFLEXn_SYS_CLK, and $f_{\text{SMARTREFLEX_CLK}}$ is the desired SMARTREFLEX_CLK frequency.

To make accurate use of the target values programmed for the SmartReflex modules in the device, the SRCLKLENGTH parameter must be set correctly. The target values for the SmartReflex modules are calculated with the SMARTREFLEX_CLK frequency set at 100 kHz. It is thus mandatory that the value of the SRCLKLENGTH parameter is calculated from Equation 1 with $f_{\text{SMARTREFLEX_CLK}}$ set at 100 kHz.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

For example, if the system clock has a frequency of 38.4 MHz, and the target SMARTREFLEX_CLK frequency is 100 kHz, the SMARTREFLEXn.SRCONFIG[21:12] SRCLKLENGTH bit field is 192 (0x0C0).

Sensor Core

The sensor cores (SVT and LVT) receive the SMARTREFLEX_CLK sampling clock and the voltage to be sensed. They generate sensor value samples proportional to the voltage sensed. For accuracy, a sensor core is composed of two sensors (N and P) and generates two values per sample (one from each sensor).

Two sample values generated by the SVT sensor core output can be read from the SMARTREFLEXn.SENVAL[15:0] SENNVAL and SMARTREFLEXn.SENVAL[31:16] SENPVAL bit fields. The other two sample values generated by the LVT sensor core output can be read from the SMARTREFLEXn.LVTSENVAL[15:0] LVTSENNVAL and SMARTREFLEXn.LVTSENVAL[31:16] LVTSENPVAL bit fields.

The SVT sensor core is enabled by the SMARTREFLEXn.SRCONFIG[10] SENENABLE bit. The LVT sensor core is enabled by the SMARTREFLEXn.SRCONFIG[4] LVTSENENABLE bit.

Accumulator

The accumulator consists of two stacks that store multiple samples of the four sensor values received from the sensor cores.

The SMARTREFLEXn.SRCONFIG[31:22] ACCUMDATA bit field defines the size of the accumulator in the number of samples to be stored. The allowable range is from 2 to 1023. The value of the SMARTREFLEXn.SRCONFIG[31:22] ACCUMDATA bit field is related to the desired sampling time window ($T_{TimeWindow}$) and the SMARTREFLEX_CLK frequency ($f_{SMARTREFLEX_CLK}$). It can be calculated using Equation 2:

$$\text{SMARTREFLEXn.SRCONFIG[31:22] ACCUMDATA} = T_{TimeWindow} * f_{SMARTREFLEX_CLK} \quad (2)$$

For example, for an accumulator time window of 10 ms and SMARTREFLEX_CLK frequency of 32 kHz, the value of SMARTREFLEXn.SRCONFIG[31:22] ACCUMDATA is 320 (0x140). The accumulation window must be large enough so that the minimum, maximum, and average counter values are accurate.

Minimum/Maximum/Average

The minimum/maximum/average block reads the samples stored in the accumulator and returns the minimum, maximum, and average values of the samples. Because the accumulator contains four separate groups of samples (one from each sensor of the sensor cores), the minimum/maximum/average block also generates four sets of minimum, maximum, and average values.

The minimum, maximum, and average values of the samples of the first SVT sensor can be read from the SMARTREFLEXn.SENMIN[15:0] SENNMIN, SMARTREFLEXn.SENMAX[15:0] SENNMAX, and SMARTREFLEXn.SENAVG[15:0] SENNAVG bit fields. The minimum, maximum, and average values of the samples of the first LVT sensor can be read from the following bit fields:

- SMARTREFLEXn.LVTSENMIN[15:0] LVTSENNMIN
- SMARTREFLEXn.LVTSENMAX[15:0] SENNMAX
- SMARTREFLEXn.LVTSENAVG[15:0] LVTSENNAVG

For the sample values of the second SVT sensor, the minimum, maximum, and average values can be read from the SMARTREFLEXn.SENMIN[31:16] SENPMIN, SMARTREFLEXn.SENMAX[31:16] SENPMAX, and SMARTREFLEXn.SENAVG[31:16] SENPAVG bit fields. For the sample values of the second LVT sensor, the minimum, maximum, and average values can be read from the following bit fields:

- SMARTREFLEXn.LVTSENMIN[31:16] LVTSENPMIN
- SMARTREFLEXn.LVTSENMAX[31:16] LVTSENPMAX
- SMARTREFLEXn.LVTSENAVG[31:16] LVTSENPAVG

The minimum/maximum/average block is enabled by the SMARTREFLEXn.SRCONFIG[8] MINMAXAVGENABLE bit.

The accumulated values and status registers are reset when one of the following occurs:

- SMARTREFLEXn.SRCONFIG[11] SRENABLE is cleared to 0x0.
- SMARTREFLEXn.IRQSTATUS[3] MCUACCUMINTSTATENA is cleared by writing 0x1 to it.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Error Generator

The error generator block reads the sample value generated by the sensor cores and compares it with a reference value to calculate the error. This error is then passed to the voltage processor and the internal interrupt generator block.

The reference value for a given OPP of the device is configured by setting the following bit fields by reading the corresponding values from the control module (see Section 3.8.3.2.6, *SmartReflex Parameters Set After Silicon Characterization*):

- SMARTREFLEXn.NVALUERECIPROCAL[23:20] SENPGAIN
- SMARTREFLEXn.NVALUERECIPROCAL[19:16] SENNGAIN
- SMARTREFLEXn.NVALUERECIPROCAL[15:8] RNSENP
- SMARTREFLEXn.LVTNVALUERECIPROCAL[23:20] SENPGAIN
- SMARTREFLEXn.NVALUERECIPROCAL[7:0] RNSENN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[19:16] SENNGAIN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[15:8] RNSENP
- SMARTREFLEXn.LVTNVALUERECIPROCAL[7:0] RNSENN

The error generator sets the SMARTREFLEXn.SRSTATUS[1] ERRORGENERATORVALID status bit when a valid error value is set in the SMARTREFLEXn.SENERROR_REG register.

The SMARTREFLEXn.SENERROR_REG register contains the average error (SMARTREFLEXn.SENERROR_REG[15:8] AVGERROR) and the percentage of error (SMARTREFLEXn.SENERROR_REG[7:0] SENERROR).

The error generator block is enabled by the SMARTREFLEXn.SRCONFIG[9] ERRORGENERATORENABLE bit.

In the error generator module, the sensor with the highest frequency error (SVT or LVT) is selected for processing the voltage change request.

Interrupt Generator

The interrupt generator block generates interrupts to INTC_MPU and the voltage processor module (if the corresponding interrupts are enabled) to indicate errors.

Table 3-300 and Table 3-301 list the interrupt events in the SmartReflex module and their enable and status bits.

Table 3-300. SmartReflex Interrupt Events

Interrupt Type	Description
Accumulator	The minimum/maximum/average module has completed computation of the accumulator data.
Valid	The average error is less than 2 percent of the true average error.
Disable acknowledge	The SmartReflex module is disabled and has cleared all INTC_MPU and VP interrupts (internal registers are reset). This interrupt indicates to the software that the SmartReflex module is available for programming.
Bounds	The frequency error has crossed the maximum limit (ERRMAXLIMIT) or the minimum limit (ERRMINLIMIT). It is also mapped to the voltage processor.

The SMARTREFLEXn_IPU_IRQs from SMARTREFLEX_MM and SMARTREFLEX_CORE are mapped to the IPU_IRQ_48 interrupt line of the INTC_IPU.

Table 3-301. SmartReflex Interrupt Events Enable and Status Bits

Interrupt Type	Enable Bit	Status Bit
Accumulator	SMARTREFLEXn.IRQENABLE_SET[3] MCUACCUMINTENSET	SMARTREFLEXn.IRQSTATUS[3] MCUACCUMINTSTATENA
	SMARTREFLEXn.IRQENABLE_CLR[3] MCUACCUMINTENCLR	

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Table 3-301. SmartReflex Interrupt Events Enable and Status Bits (continued)

Interrupt Type	Enable Bit	Status Bit
Valid	SMARTREFLEXn.IRQENABLE_SET[2] MCUVALIDINTENSET	SMARTREFLEXn.IRQSTATUS[2] MCUVALIDINTSTATENA
	SMARTREFLEXn.IRQENABLE_CLR[2] MCUVALIDINTENCLR	
Disable acknowledge	SMARTREFLEXn.IRQENABLE_SET[0] MCUDISABLEACKINTENSET	SMARTREFLEXn.IRQSTATUS[0] MCUDISABLEACKINTSTATENA
	SMARTREFLEXn.IRQENABLE_CLR[0] MCUDISABLEACKINTENCLR	
Bounds	SMARTREFLEXn.IRQENABLE_SET[1] MCUBOUNDSINTENSET	SMARTREFLEXn.IRQSTATUS[1] MCUBOUNDSINTSTATENA
	SMARTREFLEXn.IRQENABLE_CLR[1] MCUBOUNDSINTENCLR	
	SMARTREFLEXn.ERRCONFIG[22] VPBOUNDSINTENABLE	SMARTREFLEXn.ERRCONFIG[23] VPBOUNDSINTSTATENA

The minimum and maximum error limits for the bounds interrupt are configured in the SMARTREFLEXn.ERRCONFIG[15:8] ERRMAXLIMIT and SMARTREFLEXn.ERRCONFIG[7:0] ERRMINLIMIT bit fields.

Writing 1 to a bit in the SMARTREFLEXn.IRQSTATUS register clears the interrupt pending status of each interrupt source whose corresponding bit is 1 in the value written. Other interrupt pending status bits are not affected (writing 0 to that bit does not affect the status).

3.8.3.2.4 SmartReflex Convergence Verification

SmartReflex convergence verification is mandatory for the MPU, IVA, and CORE power domains. The goal of this verification is that the VSR (Voltage SmartReflex) is calibrated with SmartReflex within the expected error range. If VSR is calibrated within the expected error range, the calibration is converged without issue. If VSR is not calibrated within the expected error range, the following issues may occur:

- If the calibration of VSR is high, there is a convergence issue that could lead to an increase in power consumption.
- Low VSR (near the VMIN) could lead to platform instability.

Convergence verification requires the following steps, with at least one sample on the customer product with customer software:

1. Set the device to the desired OPP (for more information, see Section 3.10.4.3, *Changing OPP*.
2. Enable the SmartReflex in the SRCONFIG[11] SRENABLE register.
3. Wait for the SmartReflex to converge.
4. Retrieve the required SmartReflex registers to verify that the error percentage (%error) per calculation is in the expected range.

NOTE: Convergence verification must be done in the listed sequence for each power rail and each OPP.

The following registers exist for each power rail; the appropriate register must be used:

1. The following registers must be retrieved after SmartReflex has converged to verify that the convergence is within the expected range:
   - SR.SENVAL
   - SR.NVALUERECIPROCAL
   - SR.ERRCONFIG
2. The following calculations are used to verify that the obtained voltage is converged:

Copyright © 2013, Texas Instruments Incorporated

PRELIMINARY

(a) Extract the following values from the listed registers:
NCOUNT:

- COUNT of SENP = SR.SENVAL[31:16] SENPVAL
- COUNT of SENN = SR.SENVAL[15:0] SENNVAL

TARGET:

$$\text{TARGET OF SENP} = \frac{2^{[\text{hex2dec(SR.NVALUERECIPROCAL[23:20] SENPGAIN + 8)}]}}{\text{hex2dec(SR.NVALUERECIPROCAL[15:8] SENPRN)}}$$

prcm-100

$$\text{TARGET OF SENN} = \frac{2^{[\text{hex2dec(SR.NVALUERECIPROCAL[19:16] SENNGAIN + 8)}]}}{\text{hex2dec(SR.NVALUERECIPROCAL[7:0] SENNRN)}}$$

prcm-101

ERRMINLIMIT:

- ERRMINLIMIT = SR.ERRCONFIG[7:0] ERRMINLIMIT

ERRMAXLIMIT:

- ERRMAXLIMIT = SR.ERRCONFIG[15:8] ERRMAXLIMIT

(b) Calculate %error:

$$\text{SENP\%error} = \frac{\text{TARGET of SENP} - \text{COUNT of SENP}}{\text{TARGET of SENP}}$$

prcm-102

$$\text{SENN\%error} = \frac{\text{TARGET of SENN} - \text{COUNT of SENN}}{\text{TARGET of SENN}}$$

prcm-103

- %error = max(SENP%error, SENN%error)

NOTE: To be successfully converged, %error must be within the follwing range:
ERRMINLIMIN < %error < ERRMAXLIMIT

NOTE: If the %error is not within the expected range, check the SmartReflex parameters that are used in customer software.

3.8.3.2.5 Status Register

The status register (SRSTATUS) indicates the validity of the minimum/maximum/average and error generator output values.

SRSTATUS has the following bits and bit fields:

- SMARTREFLEXn.SRSTATUS[3] AVGERRVALID: Indicates the validity of the value in the SMARTREFLEXn.SENERROR_REG[15:8] AVGERROR bit field. When the value is 0, the average error is not valid. When the value is 1, the average error is within 2 percent of the valid average error.
- SMARTREFLEXn.SRSTATUS[2] MINMAXAVGVALID: Indicates the validity of the following registers:
  - SMARTREFLEXn.SENVAL
  - SMARTREFLEXn.SENMIN
  - SMARTREFLEXn.SENMAX
  - SMARTREFLEXn.SENAVG
  - SMARTREFLEXn.LVTSENVAL
  - SMARTREFLEXn.LVTSENMIN

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

  - SMARTREFLEXn.LVTSENMAX
  - SMARTREFLEXn.LVTSENAVG

  When the value is 0, the registers are not valid. When the value is 1, the registers contain valid values, although the values are not necessarily fully accumulated.
- SMARTREFLEXn.SRSTATUS[1] ERRGEN_VALID: Indicates the validity of the value in the SMARTREFLEXn.SENERROR_REG[7:0] SENERROR bit field. When the value is 0, the error value is invalid. When the value is 1, the error value is valid.
- SMARTREFLEXn.SRSTATUS[0] MINMAXAVGACCUMVALID: Indicates that the following registers contain their final values accumulated over the defined sample time period:
  - SMARTREFLEXn.SENVAL
  - SMARTREFLEXn.SENMIN
  - SMARTREFLEXn.SENMAX
  - SMARTREFLEXn.SENAVG
  - SMARTREFLEXn.LVTSENVAL
  - SMARTREFLEXn.LVTSENMIN
  - SMARTREFLEXn.LVTSENMAX
  - SMARTREFLEXn.LVTSENAVG

3.8.3.2.6 SmartReflex Parameters Set After Silicon Characterization

Certain parameters of the SmartReflex module are characterized and calibrated after silicon testing. These values are then provided separately. Users must configure these parameters according to their given values to ensure correct functioning of the module.

The values for the following parameters (explained in Section 3.8.3.2.3, *SmartReflex Submodules*) are set in the control module after device silicon characterization:

- SMARTREFLEXn.NVALUERECIPROCAL[23:20] SENPGAIN
- SMARTREFLEXn.NVALUERECIPROCAL[19:16] SENNGAIN
- SMARTREFLEXn.NVALUERECIPROCAL[15:8] SENPRN
- SMARTREFLEXn.NVALUERECIPROCAL[7:0] SENNRN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[23:20] SENPGAIN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[19:16] SENNGAIN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[15:8] SENPRN
- SMARTREFLEXn.LVTNVALUERECIPROCAL[7:0] SENNRN

The value of these parameters must be read from the corresponding registers of the control module.

Information about the following parameters of the SmartReflex module is provided after silicon characterization:

- SMARTREFLEXn.AVGWEIGHT_REG[3:2] SENPAVGWEIGHT
- SMARTREFLEXn.AVGWEIGHT_REG[1:0] SENNAVGWEIGHT
- SMARTREFLEXn.ERRCONFIG[18:16] ERRWEIGHT
- SMARTREFLEXn.ERRCONFIG[15:8] ERRMAXLIMIT
- SMARTREFLEXn.ERRCONFIG[7:0] ERRMINLIMIT

The recommended values for the ERRCONFIG register bit fields are:

- ERRCONFIG[18:16] ERRWEIGHT: Recommended value is 0x4 (1280 µs)
- ERRCONFIG[15:8] ERRMAXLIMIT: Recommended value is 0x2 (1.60%)
- ERRCONFIG[7:0] ERRMINLIMIT: Recommended values are OPP and technology-dependent. Initial development values are:
  - 0xF4 (–9.6%) for OPP_LOW
  - 0xF9 (–5.6%) for OPP_NOM

PRELIMINARY

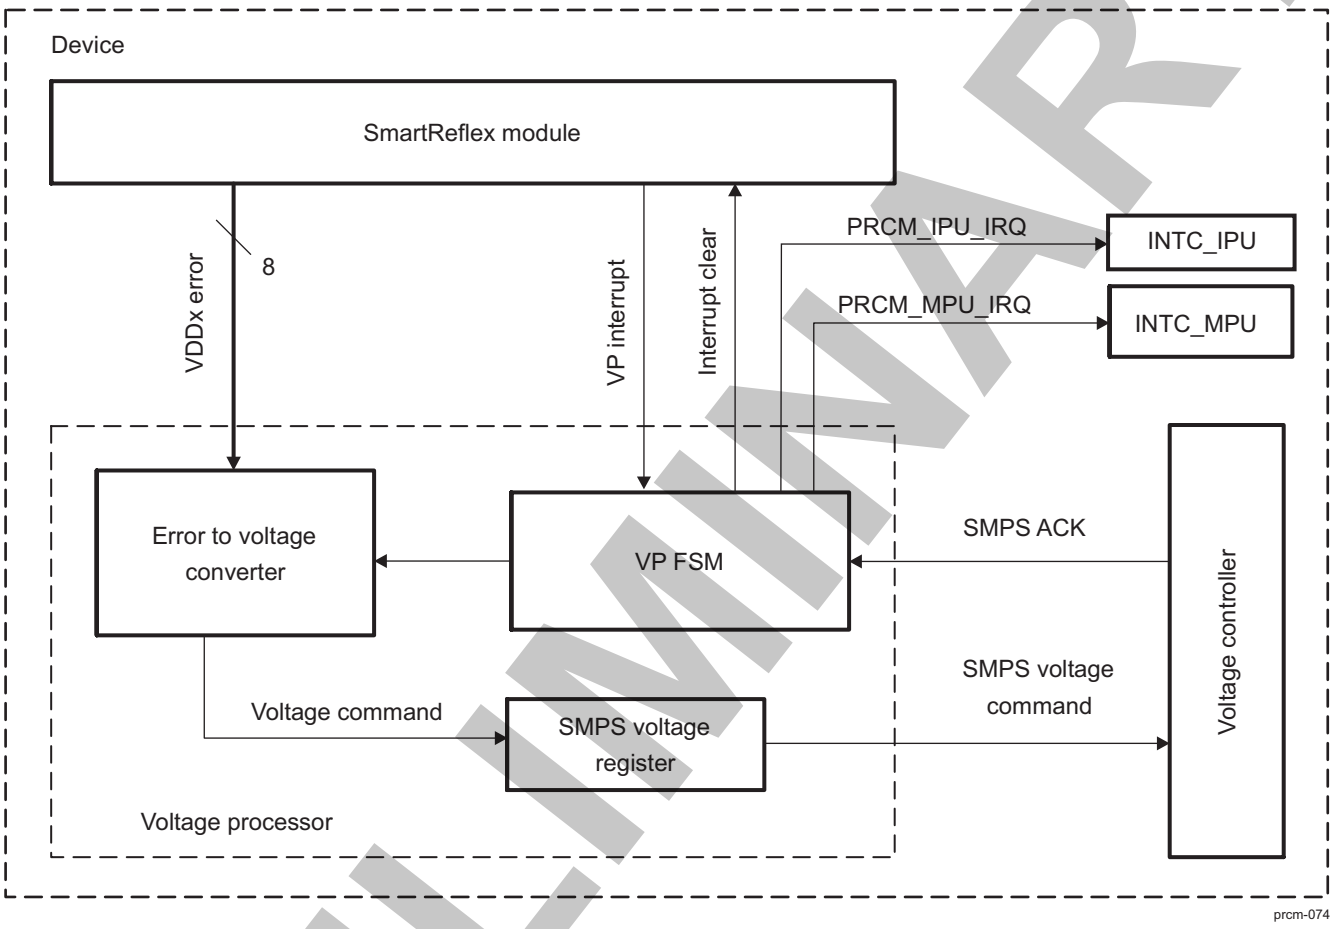
– 0xFA (–4.0%) for OPP_HIGH

3.8.3.2.7 Voltage Processor Module

Figure 3-80 is a functional overview of the voltage processor.

Figure 3-80. Voltage Processor Functional Overview



The voltage processor receives an error value and a VP interrupt signal from the SmartReflex module. Each time a new error value is sent, the SmartReflex module triggers an interrupt to inform the voltage processor. The voltage processor consists of an error-to-voltage command converter and a state controller. It processes an error and sends a voltage command to the voltage controller. It receives an acknowledge signal from the voltage controller when the SMPS receives the command. The voltage processor then acknowledges the SmartReflex module by clearing its interrupt.

The voltage processor is enabled by the PRM_VP_n_CONFIG[0] VPENABLE bit.

Voltage Processor Interrupts

The voltage processor uses the PRM_IPU_IRQ (IPU_IRQ_47 of INTC_IPU) interrupt line of the IPU and PRM_MPU_IRQ (MPU_IRQ_11 of INTC_MPU) interrupt line of the MPU. They can be enabled through PRM_IRQENABLE_IPU and PRM_IRQENABLE_MPU registers. Table 3-302 and Table 3-303 list the interrupt events in the voltage processor module and their enable and status bits.

Table 3-302. Voltage Processor Interrupt Events

Interrupt Type	Description
Transaction done	Voltage processor transaction is complete.
Equal value	Voltage requested in the new voltage command is the same as the current SMPS voltage.

Copyright © 2013, Texas Instruments Incorporated

PRELIMINARY

Table 3-302. Voltage Processor Interrupt Events (continued)

Interrupt Type	Description
No SMPS acknowledge	SMPS has not responded in a defined time interval to the transmitted voltage command.
Maximum VDD	New voltage requested in the voltage command is equal to or greater than maximum VDD.
Minimum VDD	New voltage requested in the voltage command is equal to or less than minimum VDD.
OPP change done	The average error is within the desired limit.

NOTE: Transaction done and OPP change done interrupt events are generated under the same conditions (after voltage change).

Table 3-303. Voltage Processor Interrupt Event Enable and Status Bits

Interrupt Type	Enable Bit	Status Bit
Transaction done	PRM_IRQENABLE_IPU[21] VP_CORE_TRANXDONE_EN	PRM_IRQSTATUS_IPU[21] VP_CORE_TRANXDONE_ST

	PRM_IRQENABLE_IPU[30] VC_MM_VPACK_EN	PRM_IRQSTATUS_IPU[30] VC_MM_VPACK_ST

Voltage Processor Status

The status of the voltage processor is represented by the following:

Bits	Parameter	Description
PRCM module.PRM_VPn_VOLTAGE[7:0] VPVOLTAGE	Current voltage for SMPS	Value of the current voltage level requested by the voltage processor
PRCM module.PRM_VPn_STATUS[0] VPINIDLE	Voltage processor in INACTIVE state	The voltage processor is in idle mode.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Voltage Processor Parameters

The following parameters of the voltage processor must be configured:

Bits	Parameter	Description
PRCM.PRM_VPn_CONFIG[31:24] ERROROFFSET	Error offset	Error in voltage offset value
PRCM.PRM_VPn_CONFIG[23:16] ERRORGAIN	Error gain	Error in voltage gain value
PRCM.PRM_VPn_CONFIG[3] TIMEOUTEN	Time-out enable	Enables/disables the time-out set by the time-out delay parameter. 0: Time-out is disabled, VP FSM waits indefinitely. 1: Time-out is enabled. Time out will occurs when the programmed time-out value have elapsed.
PRCM.PRM_VPn_VSTEPMIN[7:0] VSTEPMIN	Minimum step size	Minimum voltage step size
PRCM.PRM_VPn_VSTEPMAX[7:0] VSTEPMAX	Maximum step size	Maximum voltage step size
PRCM.PRM_VPn_VLIMITTO[31:24] VDDMAX	Maximum VDD limit	Maximum voltage limit of the VDD. The VDDMAX registers are the maximum allowable voltage levels of the SMPS. This value is determined by the SMPS specification as well as the application specification. The upper bound on the SMPS voltage is VddMax.
PRCM.PRM_VPn_VLIMITTO[23:16] VDDMIN	Minimum VDD limit	Minimum voltage limit of the VDD. The VDDMIN registers are the minimum allowable voltage levels of the SMPS. This value is determined by the SMPS specification as well as the application specification. The lower bound on the SMPS voltage is VddMin.
PRCM.PRM_VPn_VLIMITTO[15:0] TIMEOUT	Time-out delay	Maximum delay between a voltage change command and its acknowledge. The TIMEOUT register determines the number of SYS_CLK cycles that the voltage controller state-machine will wait for the rising edge of SMPS VP_acknowledge, when PRCM.PRM_VPn_CONFIG[3] TIMEOUTEN = 1. If PRCM.PRM_VPn_CONFIG[3] TIMEOUTEN = 0, the loop will wait indefinitely.
PRCM.PRM_VPn_CONFIG[15:8] INITVDD	Initial VDD voltage	Initial voltage set in the voltage processor
PRCM.PRM_VPn_CONFIG[2] INITVDD	Initialize VDD	Set initial voltage given in initial VDD voltage parameter in the voltage processor
PRCM.PRM_VPn_VSTEPMIN[23:8] SMPSWAITTIMEMIN	Minimum SMPS wait time	Slew rate for negative voltage steps
PRCM.PRM_VPn_VSTEPMAX[28:8] SMPSWAITTIMEMAX	Maximum SMPS wait time	Slew rate for positive voltage steps
PRCM.PRM_VPn_CONFIG[1] FORCEUPDATE	Force update	Sends the value of the VP current voltage parameter as the new voltage command to SMPS

3.8.3.2.8 SMPS-Dependent Parameter Configuration

The values of the following parameters of the voltage processor module depend on the characteristics of the SMPS used:

- PRCM.PRM_VPn_CONFIG[31:24] ERROROFFSET
- PRCM.PRM_VPn_CONFIG[23:16] ERRORGAIN
- PRCM.PRM_VPn_VSTEPMIN[7:0] VSTEPMIN
- PRCM.PRM_VPn_VSTEPMAX[7:0] VSTEPMAX
- PRCM.PRM_VPn_VLIMITTO[31:24] VDDMAX
- PRCM.PRM_VPn_VLIMITTO[23:16] VDDMIN
- PRCM.PRM_VPn_VLIMITTO[15:0] TIMEOUT
- PRCM.PRM_VPn_VSTEPMIN[23:8] SMPSWAITTIMEMIN
- PRCM.PRM_VPn_VSTEPMAX[28:8] SMPSWAITTIMEMAX

For information about the values of these parameters, see the specification document of the SMPS used.

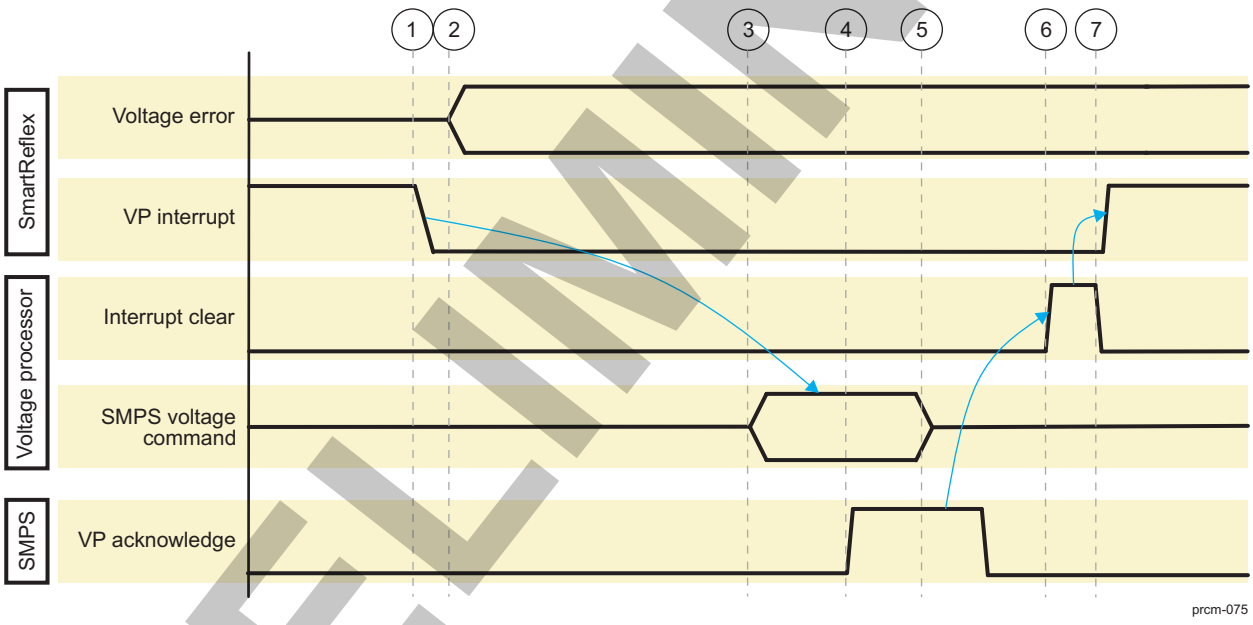
3.8.3.2.9 Communication Between SmartReflex, Voltage Processor, Voltage Controller, and SMPS

The SmartReflex module, voltage processor, voltage controller, and SMPS implement a simple handshake protocol based on a request/acknowledge mechanism (see Figure 3-81):

1. The SmartReflex module generates a VP interrupt (clears to 0) when the average error crosses the minimum or maximum error bounds.
2. The average VDDx error is passed to the voltage processor when automatic voltage control is enabled.
3. The voltage processor reads the error and generates the voltage command for the SMPS. It then informs the voltage controller that a new voltage command is ready for the SMPS. The voltage controller sends the voltage command to the SMPS (external power IC) through the dedicated I^2C interface.
4. The SMPS responds to the reception of the voltage command with an acknowledgment to the voltage controller.
5. The voltage controller sends the acknowledgment to the voltage processor.
6. The voltage processor sends the interrupt-clear signal to the SmartReflex module.
7. The SmartReflex module clears the VP interrupt. It is now again ready to send a new frequency-error interrupt to the voltage processor.

Figure 3-81. SmartReflex – SMPS Communication for Automatic Voltage Adjustments



3.8.4 Internal LDOs Control

3.8.4.1 Memory LDOs

Embedded SRAM LDOs are used to supply power to the split-rail memory arrays. The PRM generates the controls used to select LDO operating mode: on-active, on-retention, or off.

Split-rail type SRAMs are used in the device to implement the larger memories. These SRAMs feature memory array and periphery logic, which are on separate supplies to allow independent power management. Proper memory operation, however, requires the SRAM array voltage never to be operated at a level lower than the SRAM periphery logic.

Memory LDO can switch to on, retention, and off modes:

- On (active) mode: 1.15 V is the normal voltage reference used through all functional OPPs whenever memories must be functional. When logic voltage level VDD_x_L (where x can be MPU, CORE, or MM) becomes higher than the associated memory voltage level VDD_x_M, the LDO operates in tracking mode and follows its respective VDD_x_M or VDD_x_ABB voltage level.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

- Retention mode: 0.6 V is set when software allows and when all memory banks belonging to the LDO memory voltage are in RETENTION state. In this mode, the output voltage is generated from the corresponding VDD_WKUP_L logic voltage source.

Section 3.8.6.1, *Memory LDOs Transitions*, describes the state transition conditions and sequences for the memory LDOs.

NOTE: The voltage levels associated with the different modes may depend on the device characteristics.

3.8.4.2 WAKEUP LDOs

When the device enters its lower standby mode (named off mode), some logic blocks and memories remain supplied to allow restarting the device without needing to perform its full reinitialization: this is the wake-up voltage domain. This domain also includes most of the logic needed to perform the emulation and debug features. The lowest power consumption in standby mode is achieved by supplying the wake-up voltage domain only in off mode. To minimize power consumption at the platform level when the device is in this mode, all logic voltage supply regulators can be turned off, because the wake-up voltage domain is supplied by an embedded LDO using the 1.2-V I/O voltage supply on its input.

The WAKEUP LDO supports three voltage states, depending on the PD_WKUPAON and PD_EMU activity:

- EMULATION overdrive: The voltage level is 1.16 V, and the LDO is set in bypass mode. OPP_WKUP_EMULATION is reached as soon as emulation/debug is active, regardless of the device mode (standby, off, or on)
- ON: The voltage reference (default state) is 1.0 V. Other voltage domains are active or idle, emulation/debug is inactive.
- SLEEP: The voltage reference is 0.9 V. It is set when the device enters sleep mode. All other voltage domains are inactive or off, and emulation/debug is inactive.

Section 3.8.6.3, *VDD_WKUP_L Transitions,* describes the state transition conditions and sequences for the WAKEUP LDO.

NOTE: The voltage levels associated with the different modes may depend on the device characteristics.

At boot time, the WAKEUP LDO is started in emulation mode. It is a software command (that is, from OS or ROM code) to set it to a different mode.

3.8.4.3 ABB LDOs Control

The ABBLDO supports three voltage modes:

- Bypass mode: In this mode, the ABBLDO_x is bypassed and outputs the VDD_x_L voltages (x refers to the MPU and MM). This mode is activated when FBB is not required, or when the voltage domain enters low-power mode.
- FBB mode is enabled when the device is a weak process device at the highest OPP.

The PRCM module provides the PRM_ABBLDO_MPU_SETUP and PRM_ABBLDO_MM_SETUP registers for configuration with the following controls:

- SR2EN: To enable or bypass the ABB power management
- ACTIVE_FBB_SEL: To enable or bypass FBB mode
- SR2_WTCNT_VALUE: LDO settling delay on OPP change. The delay is in the number of system clock cycles.

The PRCM module provides the PRM_ABBLDO_MPU_CTRL and PRM_ABBLDO_MM_CTRL registers for control:

- OPP_SEL: Current operational OPP

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

- OPP_CHANGE: Initiate an OPP-based ABBLDO setting change
- SR2_STATUS: Current mode of operation of ABBLDO
- SR2_IN_TRANSITION: ABBLDO in transition

For the ABBLDO state-change programming sequence, see Section 3.10.4.3, *Changing OPP*.

3.8.4.4 BANDGAPsControl

BANDGAPs provides voltage reference for internal LDOs. The PRCM module automatically controls the switching between ON and OFF states of the BANDGAPs, based on the power state of the device. It is completely transparent to user software.

BANDGAPs startup time is 100 µs. The PRM_BANDGAP_SETUP[7:0] STARTUP_COUNT bit field must be set accordingly.

3.8.5 EMIF-Specific Interface

The PRCM module provides to the EMIF a special signal to increase the rate of incremental leveling during the voltage update. This signal is active when OPP changes during the voltage ramp of VD_CORE.

This signal is driven by hardware during the OPP change of VD_CORE, if it passes through the voltage processor (force update). It is controlled by software in case the OPP voltage change is done through VOLCON without passing through the voltage processor (bypass).

An override bit, PRM_VC_VAL_BYPASS[25] OPP_CHANGE_EMIF_LVL, is available. When this bit is set to 1, the special signal is forced to 1. When this bit is cleared to 0, the special signal is forced to 0 (if not driven to 1 by hardware).

3.8.6 Voltage Domain State Transitions

Section 3.1.1.3.1, *Voltage Domain*, describes the supported states of a voltage domain. This section describes the trigger conditions to enable and perform sleep and wake-up transitions on PRCM module-controlled voltage domains:

- VDD_MPU_L
- VDD_MM_L
- VDD_CORE_L
- VDD_MPU_M
- VDD_MM_M
- VDD_CORE_M

It also identifies state transition sequences for these voltage domains.

When the voltage domain state-transition control is set to automatic, the PRCM module initiates the voltage domain state transition when the required hardware conditions are satisfied. These hardware conditions can be based on the power domain state conditions and/or system clock state conditions. The PRCM module prevents any transition when the associated conditions are not satisfied.

The VDD_MPU_M, VDD_MM_M, or VDD_CORE_M memory voltage domain is automatically transitioned to the retention level whenever all memory arrays in the domain reach the RETENTION power state. Similarly, a transition back to ON power state is triggered upon one or more domain memory arrays requiring a transition back to ON power state.

If a voltage command acknowledgment is not received within an allowed response time window (communications error over the I^2C interface), an error status is logged, a global warm reset is generated, and the transition is skipped.

3.8.6.1 VDD_x_L Transitions

The transition trigger conditions for sleep transition from ON to SLEEP or RETENTION state are:

- Software setting: PRM_VOLTCTRL[a:b] AUTO_CTRL_VDD_<x>_L = SLEEP (0x1) or RETENTION (0x2)

Copyright © 2013, Texas Instruments Incorporated

PRELIMINARY

- Power state conditions:
  - For voltage domain SLEEP state transition: All power domains in the voltage domain must be in the ON-INACTIVE or the RETENTION state.
  - For voltage domain RETENTION state transition: All power domains in the voltage domain must be in the RETENTION state.
  - VDD_MPU_L (MPU voltage domain) transition status can be check by reading bit PRM_VOLTST_MPU[20] INTRANSITION. VDD_MM_L (MM voltage domain) transition status can be checked by reading bit PRM_VOLTST_MM[20] INTRANSITION.
- Clock state conditions: No clock activity on voltage domain

NOTE:

- In case of VDD_CORE_L sleep transition from ON to SLEEP state, the PD_CORE can be only in ON-INACTIVE or RETENTION state.
- In case of VDD_MPU_L and VDD_MM_L sleep transition from ON to SLEEP state, the reference and bypass clocks to their respective DPLLs must also be gated.
- In both cases, upon completion of CORE voltage domain sleep transition, PRCM asserts COREAON_IO_SRCOMP_PWRDN signal. It waits for 8 SYS_CLK cycles then disables COREAON_IO_SRCOMP_GFCLK clock.

The transition trigger condition for a wake-up transition from SLEEP or RETENTION to ON state is:

- Any wake-up event occurs on the voltage domain.

The state transition sequence is:

1. All transition trigger conditions are met.
2. The voltage controller sends an ON, SLEEP, or RETENTION command sequence over the I^2C interface.
3. The PRCM module waits for an I^2C command sequence acknowledge.
4. The PRCM module starts the voltage transition counter.
5. When the counter expires, a voltage transition is complete.

NOTE: Upon completion of CORE voltage domain transition to ON from SLEEP or RET, PRCM enables COREAON_IO_SRCOMP_GFCLK clock. It waits for 8 SYS_CLK cycles then de-asserts COREAON_IO_SRCOMP_PWRDN signal.

3.8.6.2 Memory LDO Transitions

The transition trigger condition for on-to-retention mode is:

- At least one memory bank associated with the LDO is in RETENTION state and the rest of the memory banks are in RETENTION state.

The transition sequence is:

1. Transition trigger conditions are true (that is, satisfied).
2. Switch LDO reference to RETENTION mode value if on-to-retention mode transition.
3. Start counter for LDO stabilization.
4. When counter expires, voltage transition is complete.

3.8.6.3 VDD_WKUP_L Transitions

The ON-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY state) and PD_EMU power domain is off.
- Clock states: Only the 32K clock is active in CD_WKUPAON (and the system clock is gated at the SCRM level).

Copyright © 2013, Texas Instruments Incorporated

PRELIMINARY

The SLEEP-to-ON transition trigger conditions are:

- Any device wake-up event other than emulation wake-up event

The EMULATION-to-ON transition trigger conditions are:

- Power domain states: PD_EMU is off and device is in active mode.
- Clock states: PD_EMU is off and any clock other than 32K clock is active in PD_WKUPAON.

The EMULATION-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY state) and PD_EMU power domain is off.
- Clock states: Only the 32K clock is active in CD_WKUPAON (and the system clock is gated at the SCRM level)

The SLEEP or ON-to-EMULATION transition trigger condition is:

- Any wake-up event on PD_EMU

The transition sequence is:

1. Transition trigger conditions are met.
2. VDD_WKUP_L initiates the transition.
3. Starts a counter for VDD_WKUP_L transition.
4. VDD_WKUP_L transition completes.

3.8.7 DVFS

Dynamic voltage and frequency scaling is a technique that can be used on the logic voltage domains (VDD_MPU_L, VDD_MM_L, and VDD_CORE_L), independently of one another. Upon a current or predictive performance request, determined by software according to ad hoc algorithms or heuristics, software can configure the PRCM module to change the OPP of a voltage domain. For an increase in performance, the voltage is first raised, and then the frequency is increased. For a decrease in performance, the frequency is first decreased, and then the voltage is dropped.

3.8.7.1 EMIF Clock Frequency Scaling Constraints

CD_EMIF is inside PD_CORE. The EMIF subsystem receives the following clocks:

- L3 interface clock
- DLL clock (CORE_DLL_GCLK): for the DLL only
- EMIF_PHY_GCLK clock: Clock used to access the external memory DDR_PHY and to provide the EMIF functional clock. The EMIF functional clock is EMIF_PHY_GCLK divided by 2 inside the EMIF.

The L3 interface clock frequency can be changed on the fly without affecting EMIF operations if the CORE_DLL_GCLK and EMIF_PHY_GCLK clocks are not affected. The EMIF has an internal asynchronous bridge to handle different interface and functional clocks.

When the EMIF_PHY_GCLK clock frequency is to be changed, the EMIF must be put into IDLE state. This ensures that external memory is in self-refresh mode.

Similarly, a change in the DLL frequency implies that the DLL must relock. This can be done only when the EMIF is in IDLE state. Relock time is 250 DLL clock cycles.

The EMIF clocking scheme allows for a change of the OPP without a DLL relock (that is, the DLL is clocked by a relatively low frequency supported in all OPPs); then a change of the OPP consists only in changing the frequency of the EMIF_PHY_GCLK clock (and eventually the frequency of the L3 interface clock).

The EMIF clock control requirements in the PRCM module are:

- The EMIF clock frequency setting must be done through shadow registers for the CORE_DLL_GCLK and EMIF_PHY_GCLK clocks.
- The EMIF clock frequency update bit field must be used to copy the value of the shadow register as the current value.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

- The PRCM module hardware manages the following automatic EMIF clock-frequency update sequence:
  1. Put the EMIF into IDLE state.
  2. Upload shadow register values in the corresponding current register and wait for new EMIF clocks to be stable.
  3. Return the EMIF module to ACTIVE state.

NOTE: The PRCM module must not gate the CORE_DLL_GCLK and EMIF_PHY_GCLK clocks during automatic EMIF frequency change.

Programming model to perform automatic EMIF frequency change as part or not of an OPP change (DVFS). The automatic EMIF frequency change must always be performed while CD_EMIF is under software-forced wakeup (SW_WKUP).

VDD_CORE_L voltage fixed and only clock frequency switching

Changing the frequency of the EMIF clock without changing the voltage (example, change in the value of the SYS_CLK divider while DPLL_CORE is in bypass, change of DPLL_CORE mode between bypass and lock):

1. Software writes new EMIF timing parameters in the shadow registers of the EMIF.
2. Software configures the clock selection and frequency setting shadow registers in the PRCM module.
3. The PRCM module sends an IDLE request to the EMIF (overriding software settings of the MODULEMODE bit field for the EMIF).
4. The EMIF stalls transactions on internal interconnect, completes all committed transactions to external memory, and then puts the external memory in self-refresh mode.
5. The EMIF module then acknowledges the IDLE request of the PRCM module.
6. The PRCM module uploads the values configured in the shadow register bit fields to the corresponding current register bit fields.
7. The PRCM module waits for stabilization of the EMIF_PHY_GCLK and CORE_DLL_GCLK clocks through hardware monitoring, according to new settings.
8. The PRCM module requests the EMIF to exit idle (stops the overriding of software settings of the MODULEMODE bit field for the EMIF).
9. The PRCM module clears the frequency update field.
10. The EMIF copies the timing parameter configured in the shadow register as the current values.
11. The EMIF acknowledges that the PRCM module is functional, and starts accepting the transactions on the internal interconnect.
12. If the DLL clock was changed, the EMIF waits for the DLL to be relocked and for transactions on internal interconnect, if required. The PRCM module is not aware of the DLL operations.
13. Accesses to SDRAM are serviced again.

    Software execution can be stalled during the frequency change without harm as the critical hardware sequence is performed without software intervention. After setting the frequency update field, software must poll only for its clearing.

    Accesses to external SDRAM are stalled for the following duration:

- 2-µs maximum because EMIF is entering and exiting idle
- + 250 DLL clock cycles in case the DLL clock frequency has changed
- + DPLL lock time in case DPLL is locked

VDD_CORE_L voltage change for OPP switching

It is assumed that the frequency of the DLL clock is not changed and that the DPLL_CORE mode is not changed, and remains locked. Only the frequency of the EMIF_PHY_GCLK clock is changed using the post divider. The L3 clock is likely also to be changed, but it does not affect the EMIF.

Accesses to external SDRAM must be stalled for a maximum of 2 µs because of this sequence.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Voltage scaling up consists of:

1. Software indicates to the EMIF that a voltage change operation has started to allow the EMIF to ensure regular code updates from DLL masters.
2. Software disables SmartReflex for core voltage.
3. Software performs direct VD_CORE setting to new noncorrected value (for weak silicon) and waits for voltage stabilization.
4. Software configures SmartReflex for the corresponding OPP.
5. Software re-enables SmartReflex for core voltage.
6. Software indicates to the EMIF that the voltage change operation is complete and it does not need to control the code update from DLL masters directly.

3.8.7.2 GPMC Clock Frequency Scaling Constraints

CD_L3_MAIN2 is inside the PD_CORE. It supplies the L3MAIN2_L3_GICLK clock to the general-purpose memory controller (GPMC) module, which is used as an interface and functional clock. GPMC timing parameters are programmed at boot for the nominal OPP. These timing parameters can be used for lower L3 frequency, at the expense of slower access to external memory.

External memory connected to the GPMC may not support on-the-fly L3 frequency changes. The following is the sequence to perform L3 frequency change as part or not of an OPP change (DVFS):

- Hardware-controlled sequence:
  1. Software writes new L3 clock settings in the shadow register and sets the frequency update field.
  2. The PRCM module requests idle to the GPMC.
  3. The GPMC requests disconnection of its interconnect port and completes all outstanding transactions.
  4. The GPMC acknowledges idle. Any access to the GPMC is then stalled.
  5. The PRCM module uploads the values of the shadow register bit field in the corresponding current bit field.
  6. The PRCM module waits for stabilization of the L3 clocks by monitoring the DPLL_CORE clock and/or divider acknowledge signals according to new settings.
  7. The PRCM module clears the frequency update field.
  8. The PRCM module requests the GPMC to exit idle.
  9. The GPMC reallows interconnect connection and acknowledges it is functional.
  10. Accesses to external memory are serviced again.

  NOTE:
  - The frequency update field is the same as the one for the EMIF clock change. The same hardware in the PRCM module handles the frequency change of the L3, DDR_PHY, and DLL clocks.
  - If the GPMC supports on-the-fly L3 frequency change, then the CM_SHADOW_FREQ_CONFIG2[0] GPMC_FREQ_UPDATE bit can allow bypassing of the sequence.

- Software-controlled sequence:
  1. Software configures the PRCM module to disable the GPMC.
  2. The PRCM module requests idle to the GPMC.
  3. The GPMC requests disconnection of its interconnect port and completes all outstanding transactions.
  4. The GPMC acknowledges idle. Any access to GPMC is then stalled.
  5. Software programs the PRCM module to change L3 frequency and wait for L3 stabilization.
  6. Software configures the PRCM module to reenable the GPMC.
  7. The GPMC reallows interconnect connection and acknowledges it is functional.

PRELIMINARY

8. Accesses to external memory are serviced again.

3.8.7.3 CORE DVFS Versus Subsystem Functionality

3.8.7.3.1 Display Subsystem

The display subsystem is part of the CORE voltage domain. It has internal FIFOs that are sized to sustain a change of OPP on the CORE voltage domain with no DPLL relock and no DLL frequency change. Accesses to external SDRAM are stalled for a maximum of 2 µs in these conditions. The display subsystem functional clock is not affected by the change of OPP on the CORE voltage domain. Therefore, the display subsystem supports on-the-fly DVFS of the CORE voltage domain, assuming the selected OPP remains compatible with the current display subsystem processing.

3.8.7.3.2 IVA

IVA is part of the MM voltage domain. It can sustain a temporary stall of external SDRAM accesses because it is not real-time processing. The IVA functional clock is not affected by the change of OPP on the CORE voltage domain; therefore, IVA supports on-the-fly DVFS of the CORE voltage domain.

3.8.7.3.3 Imaging Subsystem

The imaging subsystem (ISS) is part of the CORE voltage domain. It is real-time processing (or data flow). It cannot support a 2-µs stall of external SDRAM access, because of the heavy data throughput (FIFO size increase is prohibitive). As a consequence, the ISS does not support on-the-fly change of OPP on the CORE voltage domain. However, the CORE DVFS can be synchronized to the interframe idle window of the ISS. During this window, the ISS does not initiate a transaction to external SDRAM. The CORE OPP can be changed safely assuming the selected OPP remains compatible with the current ISS processing. The ISS functional clock frequency can remain unchanged or be scaled according to the OPP change, assuming it remains compatible with the current ISS processing. This is the responsibility of software.

Software performs the OPP change: OPP_LOW → OPP_NOM: The ISS/IPU primary functional clock is now running at 400 MHz, software sets the ISS clock divider to 4, and the ISS functional clock is back at 100 MHz.

PRELIMINARY

3.9 Device Low-Power States

The device low-power states are the result of any valid combination of power domain states in which all the power domains are no longer in ACTIVE state. In such a situation the PRCM module hardware can trigger events to further lower the consumption of the device and the system.

Typically, the PRCM module can lower or even turn off the SMPS, shut down the system clock supplier, and allow the external power IC to turn off its internal resources.

These device low-power states are characterized by the system power consumption, wake-up latency, and required functionality.

The low-power states are:

- RETENTION: All logic voltage domains (VDD_MPU_L, VDD_MM_L, and VDD_CORE_L) are in RETENTION state.
- LOW POWER: Any combination of logic voltage domain states (SLEEP or RETENTION) other than those previously identified.

Once the PRCM module hardware detects any valid combination of power domain states, and if a proper programming model of the PRCM module is set, the PRCM module automatically triggers the transition into the device low-power mode.

3.9.1 Device Wake-Up Source Summary

Each power domain in the device may contain modules that can generate wake-up events. Modules in the other power domains require that their voltage domain be in RETENTION, SLEEP, or ON state to generate a wake-up event. Some modules may have a further constraint that their power domain must be in ON-INACTIVE or CSWR RETENTION state to generate a wake-up event.

The wake-up events can be asynchronous or synchronous. Synchronous wake-up events require the 32-kHz clock or the system clock to be active, while asynchronous wake-up events do not require an active clock.

The *Modules Attributes* subsection of each clock domain in Section 3.6, *Clock Management Functional Description*, describes the wake-up capability support for each module of the corresponding power domain.

While the device is in STANDBY mode, additional asynchronous wakeup events from other domains are able to wake up the device.

Table 3-304 identifies which modules in which power domains can be configured to generate a wake-up while the device is in a low-power mode.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Table 3-304. Wake-Up Sources During Device Low Power Mode

Device Power Mode	VDD_CORE state	VDD_MPU state	VDD_MM state	Domain able to generate wakeup	Wakeup source
STANDBY	Any combination of RET or SLEEP state			PD_ABE[1]	DMIC, McASP, WD_TIMER3
					McBSP1, McBSP2, McBSP3
					McPDM
				PD_CORE	IPU[2][3]
					DMA_SYSTEM[2][3]
					[1][4]
					GPIO2, GPIO3, GPIO4, GPIO5, GPIO6, GPIO7, GPIO8
					I2C1, I2C2, I2C3, I2C4, I2C5
					MCSPI1, MCSPI2, MCSPI3, MCSPI4
					MMC3, MMC4, MMC5
					UART1, UART2, UART3, UART4, UART5, UART6
				PD_L3_INIT[1]	MMC1, MMC2
					HSI[4], IEEE1500_2_OCP[3]
					SATA[4]
					USB_OTG_SS
					USB_HOST_HS, USB_TLL_HS
				PD_MPU	MPU[2][3]
				PD_DSP	DSP[2][3]
				PD_WKUPAON	GPIO1
					TIMER1, TIMER12
					PRM interrupt request towards MPU, IPU, or DSP
				PD_EMU	Any FORCEACTIVE directive
					Dynamic depedency towards L3_MAIN_2

(1) Only modules able to generate asynchronous wake-up have to be taken into account, and only when domain is in INACT or CSWRET state.
(2) True in every domain power state
(3) These modules have master wake-up (mwakeup) capability.
(4) These modules have both master wake-up and slave wake-up capability.

3.9.2 Device RETENTION State Management

In RETENTION state, the voltages to the device are lowered to their minimum value to retain only the logic build with RFFs, while all DFF logic is lost. The memory area may be retained, depending on the software configuration.

The device integrates enhanced device wake-up management while in RETENTION state. This allows:

- Triggering wakeup with limited capabilities from almost all programmed input pads around the device

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

- Triggering wakeup with full capabilities by using few GPIO inputs in the PD_WKUPAON power domain

The logic voltages VDD_CORE_L, VDD_MPU_L, and VDD_MM_L can transition to their retention value independently. Once the voltage domain state transition conditions are met in compliance with the software configuration, the PRCM module hardware initiates the transition into RETENTION state by sending an I^2C command for the corresponding SMPS.

When all the logic voltages are transitioned to their RETENTION state, the PRCM module hardware can, depending on a software configuration, toggle its system clock request and/or its power request to allow the SCRM to shut down the system clock source and to request the external power IC to shut down internal resources.

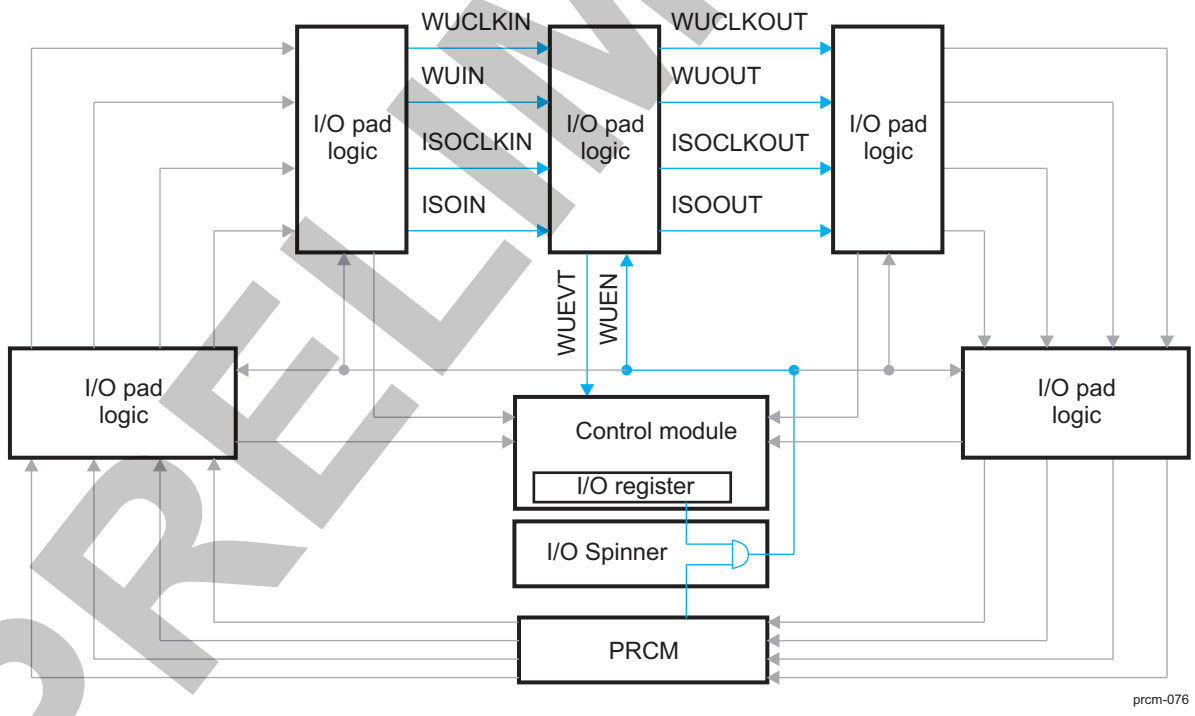
The PRCM module, SCRM, and the external power IC can also be programmed so that the voltage VDD_CORE_L is managed by the power request signal. This means:

- The power IC manages the ramp-down and ramp-up time of the VDD_CORE_L SMPS when the power request is toggled.
- The SCRM accounts for the overall setup of the PMIC resources (internal PMIC resources and VDD_CORE_L SMPS).
- The PRCM module sends RETENTION and ON commands through the I^2C interface. The value of the RETENTION voltage must be equal to the value of the current voltage, and the value of the ON voltage must be set to the expected voltage value following the wakeup. Also, the setup time periods corresponding to the SMPS ramp up and ramp down must be set to 0.

3.9.3 I/O Management

Figure 3-82 is an overview of the power-management modules and their internal connections with a generic power domain.

Figure 3-82. I/O Pads Daisy-Chain Configuration



The I/O pad logic at the two ends of the chain is connected to the PRM.

The I/O pad wake-up scheme must be enabled (WUEN signal) globally by setting the PRM_IO_PMCTRL[16] GLOBAL_WUEN bit and by also setting the I/O pad wake-up enabled/disabled individually (WUEN signal) by writing to the following bits in the control module:

- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y[14] X_WAKEUPENABLE

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y[30] Y_WAKEUPENABLE

Once configured, the wake-up scheme within each I/O pad is enabled and disabled by triggering a control (WUCLKIN signal) of the I/O daisy chain. This is done through the PRM_IO_PMCTRL[8] WUCLK_CTRL bit. Software must enable the I/O wakeup before entering low-power mode and must disable it following a wake-up event.

Setting the PRM_IO_PMCTRL[8] WUCLK_CTRL bit to 1 asserts the WUCLKIN signal high to reset spurious wake-up event and to latch the current pad input value. The PRM_IO_PMCTRL[9] WUCLK_STATUS bit logs the WUCLKOUT signal of the last pad of the I/O ring. When this status is set to 1, software can clear the PRM_IO_PMCTRL[8] WUCLK_CTRL bit to effectively enable or disable the wake-up feature within each pad.

Additionally, it is required that WUCLKIN is forced to 1 during global POR. The I/O wake-up feature is enabled or disabled depending on a control (WUEN) for each I/O pad. This control is generated by the SPINNER logic resulting from the combination of a local enable/disable bit per pad in the control module and a global enable/disable bit in the PRCM module (that is, the PRM_IO_PMCTRL[16] GLOBAL_WUEN bit).

When a wake-up event is detected by a wakeup-enabled I/O pad in the daisy chain, it is logged within the I/O and is conveyed to the system control module (WUEVT signal). All the I/O wake-up event statuses are mapped on memory-mapped registers in the system control module.

When the device wakes up, the MPU can determine all sources of the current wake-up event logged into the following corresponding bits in the control module:

- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y[15] X_WAKEUPEVENT
- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y[31] Y_WAKEUPEVENT

For information about the control module, see Chapter 18, *Control Module*.

3.9.3.1 Hardware-Controlled I/O Isolation Sequences

I/Os have two buffers: 1.2 V and 1.8 V.

The software configuration determines whether the 1.2-V buffer or the 1.8-V buffer is used.

3.9.3.2 Software-Controlled I/O Isolation

In addition to the hardware-controlled I/O transitions, the PRM_IO_PMCTRL[0] ISOCLK_OVERRIDE bit can be used by software to force the ISOCLKIN signal to the I/O pad. It is then propagated from one pad to the other in the wake-up enabled daisy chain of I/Os. The PRM_IO_PMCTRL[1] ISOCLK_STATUS bit logs the ISOCLKOUT signal of the last pad of the I/O daisy chain.

NOTE: Override must be used at boot time only when software must change the mode of an I/O from 1.8-V default mode to 1.2-V mode. When not overridden, this signal is controlled only by hardware.

The PRM_IO_PMCTRL[4] ISOOVR_EXTEND bit allows extending the non-EMIF I/O isolation. This feature can be used by software to restore modules driving output, such as GPIO, while non-EMIF I/Os are still isolated. Once software completes the relevant module restore, it clears the bit and hardware performs full-isolation-to-EMIF on the hardware-controlled I/O transition.

The PRM_IO_PMCTRL[5] IO_ON_STATUS bit is available for software to check completion of the EMIF on transition.

3.10 PRCM Module Programming Guide

3.10.1 DPLLs Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the module.

3.10.1.1 Global Initialization

3.10.1.1.1 Surrounding Module Global Initialization

This section identifies the requirements for initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

Table 3-305 describes the global initialization of the surrounding modules.

Table 3-305. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Ensure that the DPLL reference clock (gated version of system clock) is active.

3.10.1.1.2 DPLL Global Initialization

3.10.1.1.2.1 Main Sequence – DPLL Global Initialization

This procedure initializes the DPLL after a POR or software reset and then locks it to the desired synthesized clock frequency.

Table 3-306. DPLL Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure SSC parameters.	See Section 3.10.1.1.2.2.	
Configure recalibration parameters.	See Section 3.10.1.1.2.3.	
Set DPLL automatic idle mode.	CM_AUTOIDLE_<DPLL name>[2:0] AUTO_DPLL_MODE	xx(1)
Configure synthesized clock parameters.	See Section 3.10.1.1.2.4.	
Configure output clocks parameters.	See Section 3.10.1.1.2.5.	
Lock DPLL.	CM_CLKMODE_<DPLL name>[2:0] DPLL_EN	0x7

(1) It depends on the desired auto idle mode. See Section 3.6.3.3.3, *DPLL Power Modes*.

3.10.1.1.2.2 Subsequence – SSC Parameter Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

Table 3-307. DPLL SSC Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Configure M Step Size.	CM_SSC_DELTAMSTEP_<DPLL name>[19:0] DELTAMSTEP	xx(1)
Configure modulation frequency divider exponent part.	CM_SSC_MODFREQDIV_<DPLL name>[10:8] MODFREQDIV_EXPONENT	xx(1)
Configure modulation frequency divider mantissa part.	CM_SSC_MODFREQDIV_<DPLL name>[6:0] MODFREQDIV_MANTISSA	xx(1)
Enable/disable frequency downspread.	CM_CLKMODE_<DPLL name>[14] DPLL_SSC_DOWNSPREAD	xx(2)

(1) See the SSC description in Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*.
(2) The selected value depends on the desired SSC feature settings.

PRELIMINARY

Table 3-307. DPLL SSC Parameter Configuration (continued)

Step	Register/Bit Field/Programming Model	Value
Enable SSC feature.	CM_CLKMODE_<DPLL name>[12] DPLL_SSC_EN	0x1
Wait until SSC start acknowledge.	CM_CLKMODE_<DPLL name>[13] DPLL_SSC_ACK	0x1

3.10.1.1.2.3 Subsequence – Recalibration Parameter Configuration

This procedure enables the recalibration feature and the associated processor interrupt flag.

Table 3-308. DPLL Recalibration Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Clear recalibration interrupt status.	PRM_IRQSTATUS _<Processor name>[x] <DPLL name>_RECAL_ST	0x0
Unmask recalibration interrupt flag.	PRM_IRQENABLE _<Processor name>[x] <DPLL name>_RECAL_EN	0x1
Enable recalibration feature.	CM_CLKMODE_<DPLL name>[8] DPLL_DRIFTGUARD_EN	0x1

3.10.1.1.2.4 Subsequence – Synthesized Clock Parameter Configuration

This procedure configures the settings for the synthesized clock of the DPLL.

Table 3-309. DPLL Synthesized Clock Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Set DPLL clock synthesis multiplier.	CM_CLKSEL_<DPLL name>[18:8] DPLL_MULT	xx(1)
Set DPLL clock synthesis divider.	CM_CLKSEL_<DPLL name>[6:0] DPLL_DIV	xx(1)
IF : Low-power mode operation conditions satisfied?	Software test condition. See Section 3.6.3.3.2.	
Enable DPLL low-power operation mode.	CM_CLKMODE_<DPLL name>[10] DPLL_LPMODE_EN	0x1
ENDIF		

(1) It depends on the desired synthesized clock frequency. See Section 3.6.3.3, *Generic DPLL Overview*.

3.10.1.1.2.5 Subsequence – Output Clock Parameter Configuration

This procedure configures the settings for the output clocks of the DPLL.

Table 3-310. DPLL Output Clock Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Set output clock dividers (that is, M2, M3, and Hmn), where m is 1 or 2, and n is from 1 to 4. It depends on the available clock output of the DPLL.	CM_DIV_M2_<DPLL name>[4:0] DIVHS CM_DIV_M3_<DPLL name>[4:0] DIVHS CM_DIV_Hmn_<DPLL name>[5:0] DIVHS	xx(1)

(1) It depends on the desired output clock frequency. See Section 3.6.3.3, *Generic DPLL Overview*.

- For type A DPLLs: Idle Low Power bypass mode (0x5) and Idle Fast Relock bypass mode (0x6)
- For type B DPLLs: Low Power Stop mode (0x1) and Idle Low Power bypass mode (0x5)

Table 3-311 and Table 3-312 summarize register and subprocess call sequences for DPLL output frequency changes.

Table 3-311. Register Call Summary for Sequence – DPLL Output Frequency Change

Register Name
CM_CLKMODE_DPLL name

Table 3-312. Subprocess Call Summary for Sequence – DPLL Output Frequency Change

Subprocess Name	Cross-Reference
Configure synthesized clock parameters.	See Section 3.10.1.1.2.4.
Configure output clocks parameters.	See Section 3.10.1.1.2.5.

3.10.2 Clock Management Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the clocks in the device.

3.10.2.1 Global Initialization

3.10.2.1.1 Surrounding Module Global Initialization

This section identifies the requirements for initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

Table 3-313 describes the global initialization of the surrounding modules.

Table 3-313. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM DPLLs	Ensure that the DPLLS managed by the PRCM module are initialized.

3.10.2.1.2 Clock Management Global Initialization

3.10.2.1.2.1 Main Sequence – Clock Domain Global Initialization

This procedure initializes the clock domain of the device after a POR or software reset.

Table 3-314. Clock Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure module clock-management feature of master modules in the clock domain.	<Module name>_SYSCONFIG[x] MIDLEMODE <Module name>_SYSCONFIG[x] STANDBYMODE	xx(1)
Configure module clock-management feature of slave modules in the clock domain.	See Section 3.10.3.3.	
Enable/disable static sleep dependency with other clock domains (that is, destination clock domains). Not all dependencies are configurable.	CM_<Clock Domain name>_STATICDEP[x] <Destination Clock Domain name>_STATDEP	0x0: Disable 0x1: Enable
Set dynamic dependency window size.	CM_<Clock Domain name>_DYNAMICDEP[27:24] WINDOWSIZE	xx(2)

(1) See the module register for valid modes.
(2) It depends on the desired size of the window. See Section 3.1.1.1.7.2, *Clock Domain Dependency*.

PRELIMINARY

Table 3-314. Clock Domain Global Initialization (continued)

Step	Register/Bit Field/Programming Model	Value
Enable/disable module wake-up dependency for the modules of the clock domain. It is available when the module can generate an interrupt or a DMA request to a service provider module (for example, a processor or DMA).	PM_<Clock Domain name>_<Module name>_WKDEP[x] WKUPDEP_<Module name>_<DMA/IRQ reques>t_<DMA/Processor name>	0x0: Disable 0x1: Enable
Set clock domain state transition feature.	CM_<Clock Domain name>_CLKSTCTRL[1:0] CLKTRCTRL	xx(3)

(3) It depends on the desired state of the clock domain. See Table 3-11.

3.10.2.1.2.2 Subsequence – Slave Module Clock-Management Parameters Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

Table 3-315. Slave Module Clock-Management Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Configure module idle mode feature.	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	xx(1)
IF : Smart-idle mode is selected	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	0x10
Configure module clock requirement feature.	<Module name>_SYSCONFIG[x] CLOCKACTIVITY	x(1)
ENDIF		
Configure module management behavior on the PRCM module side.	CM_<Clock Domain name>_<Module name>_CLKCTRL[1:0] MODULEMODE	xx(2)

(1) See the module register for valid settings.
(2) The selected value depends on the desired clock-management behavior.

3.10.2.2 Clock Domain Sleep Transition and Troubleshooting

This procedure initiates a sleep transition on a clock domain and allows debugging if the transition does not occur.

Table 3-316. Clock Domain Sleep Transition and Troubleshooting

Step	Register/Bit Field/Programming Model	Value
Set clock domain sleep transition state.	CM_<Clock Domain name>_CLKSTCTRL[1:0] CLKTRCTRL	0x1: SW_SLEEP 0x3: HW_AUTO
IF : Clock domain sleep transition not initiated?		
Check that all clock domain master modules are in standby mode.	CM_<Clock Domain name>_<Module name>_CLKCTRL[18] STBYST	0x1: Module in standby
Check that all clock domain slave modules are in idle mode.	CM_<Clock Domain name>_<Module name>_CLKCTRL[17:16] IDLEST	0x1: In transition 0x2: Interface clock idled 0x3: Module idled
ENDIF		

3.10.2.3 Enable/Disable Software-Programmable Static Dependency

To change the setting of a software-programmable static dependency, use the procedure described in Table 3-317.

Table 3-317. Enable/Disable Software-Programmable Static Dependency

Step	Register/Bit Field/Programming Model	Value
Force destination domain to be awake (SW_WKUP).	CM_<Dest_CDname>_CLKSTCTRL[1:0] CLKTRCTRL	0x2

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Table 3-317. Enable/Disable Software-Programmable Static Dependency (continued)

Step	Register/Bit Field/Programming Model	Value
Wait until power domain that encloses the destination domain is ON.	PM_<Dest_PDname>_PWRSTST	=0x3
Change the static dependency.	CM_<Src_CDname>_STATICDEP[x] Dest_CDname_STATDEP	0x1
Put destination domain back to automatic transition (HW_AUTO).	CM_<Dest_CDname> _CLKSTCTRL[1:0] CLKTRCTRL	0x3

3.10.3 Power Management Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and control of the power domain in the device.

3.10.3.1 Global Initialization

3.10.3.1.1 Surrounding Module Global Initialization

Initialization of any surrounding modules within the device is not required. The external power IC and the device clocks should be active.

3.10.3.1.2 Power Management Global Initialization

3.10.3.1.2.1 Main Sequence – Power Domain Global Initialization and Setting

This procedure initializes the power domain of the device after a POR or software reset.

Table 3-318. Power Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure memory area power state when the power domain is on. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x1: RETAINED 0x3: ON
Configure memory area power state when the power domain transitions to RETENTION state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_RETSTATE	0x1: RETAINED
Configure logic area RETENTION power state when the power domain transitions to RETENTION state.	PM_<Power Domain name>_PWRSTCTRL[2] LOGICRETSTATE	0x1: CSWR
Select target power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE
Wait until power state change is complete.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE

3.10.3.2 Forced Memory Area State Change With Power Domain ON

This procedure initiates a forced memory area state change while the power domain is ON.

Table 3-319. Forced Memory Area State Change With Power Domain ON

Step	Register/Bit Field/Programming Model	Value
Configure memory area target power state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x1: RETAINED 0x3: ON
Get memory area current state.	PM_<Power Domain name>_PWRSTST[x] <Memory Bank name>_STATEST	0x1: RETAINED 0x3: ON

PRELIMINARY

3.10.3.3 Forced Power Domain Low-Power State Transition

This procedure initiates a power state transition on a power domain from current low-power state (ON-INACTIVE or RETENTION) to a lower power state (RETENTION).

Table 3-320. Forced Power Domain Low-Power State Transition

Step	Register/Bit Field/Programming Model	Value
Select target low-power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x1: RETENTION
Force power domain low-power state transition.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x1: Force change
Wait until state change is complete.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x0: Change complete
Get current power state.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x1: RETENTION

3.10.4 Voltage Management Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and management of the voltage domains of the device.

3.10.4.1 Global Initialization

3.10.4.1.1 Surrounding Module Global Initialization

Initialization of any surrounding modules within the device is not required. The external power IC and the device clocks should be active.

3.10.4.1.2 Voltage Management Global Initialization

3.10.4.1.2.1 Main Sequence – Voltage Management Global Initialization and Setting

This procedure initializes the voltage management framework in the device.

Table 3-321. Power Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Initialize SmartReflex modules.	See Section 3.10.4.1.3.	
Initialize voltage processor modules.	See Section 3.10.4.1.4.	
Initialize voltage controller module.	See Section 3.10.4.1.5.	

3.10.4.1.3 SmartReflex Module Initialization

This procedure initializes the SmartReflex module.

Table 3-322. SmartReflex Module Configuration

Step	Register/Bit Field/Programming Model	Value
Configure clock.	See Section 3.10.4.1.3.1.	
Configure sensor.	See Section 3.10.4.1.3.2.	
Configure accumulator and minimum/maximum/average.	See Section 3.10.4.1.3.3.	
Configure error generator.	See Section 3.10.4.1.3.4.	
Configure interrupt generator.	See Section 3.10.4.1.3.5.	
Enable module.	SMARTREFLEXn.SRCONFIG[11] SRENABLE	0x1

PRELIMINARY

3.10.4.1.3.1 Subsequence – Clock Configuration

This procedure configures the clock for the SmartReflex module.

Table 3-323. SmartReflex Module Clock Configuration

Step	Register/Bit Field/Programming Model	Value
Configure desired clock frequency.	SMARTREFLEXn.SRCONFIG[21:12] SRCLKLENGTH	xx(1)
Configure desired idle mode.	SMARTREFLEXn.ERRCONFIG[25:24] IDLEMODE	0x0: Forced-idle 0x1: No-idle 0x2: Smart-idle 0x3: Smart-idle wakeup
Enable/disable wake-up feature.	SMARTREFLEXn.ERRCONFIG[26] WAKEUPENABLE	0x0: Disable 0x1: Enable
Enable clock.	CM_COREAON_ SMARTREFLEX_<SR name>_CLKCTRL[1:0] MODULEMODE	0x2: Enable

(1) See Equation 1 for clock frequency calculation.

3.10.4.1.3.2 Subsequence – Sensors Configuration

This procedure configures the sensors in the SmartReflex module.

Table 3-324. SmartReflex Module Sensors Configuration

Step	Register/Bit Field/Programming Model	Value
Enable SVT sensor core N.	SMARTREFLEXn.SRCONFIG[1] SENNENABLE	0x1
Enable SVT sensor core P.	SMARTREFLEXn.SRCONFIG[0] SENPENABLE	0x1
Enable SVT sensor core.	SMARTREFLEXn.SRCONFIG[10] SENENABLE	0x1
Enable LVT sensor core N.	SMARTREFLEXn.SRCONFIG[3] LVTSENNENABLE	0x1
Enable LVT sensor core P.	SMARTREFLEXn.SRCONFIG[2] LVTSENPENABLE	0x1
Enable LVT sensor core.	SMARTREFLEXn.SRCONFIG[4] LVTSENENABLE	0x1

3.10.4.1.3.3 Subsequence – Accumulator and Min/Max/Avg Configuration

This procedure configures the accumulator and minimum/maximum/average part of the SmartReflex module.

Table 3-325. Accumulator and Minimum/Maximum/Average Configuration

Step	Register/Bit Field/Programming Model	Value
Set size of the accumulator.	SMARTREFLEXn.SRCONFIG[31:22] ACCUMDATA	xxx(1)
Set average weight parameter for sensor A.	SMARTREFLEXn.AVGWEIGHT_REG[1:0] SENNAVGWEIGHT	x(1)
Set average weight parameter for sensor B.	SMARTREFLEXn.AVGWEIGHT_REG[3:2] SENPAVGWEIGHT	x(1)
Enable minimum/maximum/average.	SMARTREFLEXn.SRCONFIG[8] MINMAXAVGENABLE	0x1

(1) These parameters are calculated as given in Section 3.8.3.2.3, *SmartReflex Submodules*.

3.10.4.1.3.4 Subsequence – Error Generator Configuration

This procedure configures the error generator part of the SmartReflex module.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Table 3-326. Error Generator Configuration

Step	Register/Bit Field/Programming Model	Value
Configure four reference value parameters for SVT sensor core.	SMARTREFLEXn.NVALUERECIPROCAL[23:20] SENPGAIN	x[1]
	SMARTREFLEXn.NVALUERECIPROCAL[19:16] SENNGAIN	x[1]
	SMARTREFLEXn.NVALUERECIPROCAL[15:8] SENPRN	xx[1]
	SMARTREFLEXn.NVALUERECIPROCAL[7:0] SENNRN	xx[1]
Configure four reference value parameters for LVT sensor core.	SMARTREFLEXn.LVTNVALUERECIPROCAL[23:20] SENPGAIN	x[1]
	SMARTREFLEXn.LVTNVALUERECIPROCAL[19:16] SENNGAIN	x[1]
	SMARTREFLEXn.LVTNVALUERECIPROCAL[15:8] SENPRN	xx[1]
	SMARTREFLEXn.LVTNVALUERECIPROCAL[7:0] SENNRN	xx[1]
Enable the error generator.	SMARTREFLEXn.SRCONFIG[9] ERRORGENERATORENABLE	0x1

(1) Configured according to the values read for the current operating voltage level from the control module register in Section 3.8.3.2.3, *SmartReflex Submodules*.

3.10.4.1.3.5 Subsequence – Interrupt Generator Configuration

This procedure configures the interrupt generator part of the SmartReflex module.

Table 3-327. Interrupt Generator Configuration

Step	Register/Bit Field/Programming Model	Value
Set the four reference value parameters.	SMARTREFLEXn.ERRCONFIG[18:16] ERRWEIGHT	x
	SMARTREFLEXn.ERRCONFIG[15:8] ERRMAXLIMIT	xx
	SMARTREFLEXn.ERRCONFIG[7:0] ERRMINLIMIT	xx
IF : Automatic voltage control using voltage processor	Software test condition	
Clear voltage processor bounds interrupt status.	SMARTREFLEXn.ERRCONFIG[23] VPBOUNDSINTSTATENA	0x1
Unmask voltage processor bounds interrupt.	SMARTREFLEXn.ERRCONFIG[22] VPBOUNDSINTENABLE	0x1
ELSE-IF : Software-controlled voltage management	Software test condition	
Unmask <processor> interrupt events.	SMARTREFLEXn.IRQENABLE_SET[3] MCUACCUMINTENASET	0x1
	SMARTREFLEXn.IRQENABLE_SET[2] MCUVALIDINTENASET	0x1
	SMARTREFLEXn.IRQENABLE_SET[1] MCUBOUNDSINTENASET	0x1
ENDIF		

3.10.4.1.4 Voltage Processor Initialization

This procedure initializes the voltage processor.

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Table 3-328. Voltage Processor Module Initialization

Step	Register/Bit Field/Programming Model	Value
Configure error-to-voltage converter.	See Section 3.10.4.1.4.1.	
Configure PRCM module.	See Section 3.10.4.1.4.2.	
Mask/unmask interrupt events.	PRCM.PRM_IRQENABLE_<Processor name>	
Enable module.	PRCM.PRM_<Voltage Processor name>_CONFIG[0] VPENABLE	0x1

3.10.4.1.4.1 Subsequence – Error-to-Voltage Converter Configuration

This procedure configures the error-to-voltage converter of the voltage processor.

Table 3-329. Error-to-Voltage Converter Configuration

Step	Register/Bit Field/Programming Model	Value
Set error offset. Offset value in the Error to Voltage converter (8-bit signed two's complement number)(1). The default value for ERROROFFSET is zero.	PRCM.PRM_<Voltage Processor name>_CONFIG[31:24] ERROROFFSET	xx(2)
Set error gain. Gain value in the Error to Voltage converter (8-bit signed two's complement number). ERRORGAIN = ((Error2voltageGAIN(3))*100/SMPSstepsize)	PRCM.PRM_<Voltage Processor name>_CONFIG[23:16] ERRORGAIN	xx(2)
Set SMPS negative voltage step slew rate (in number of cycles per SMPS step).	PRCM.PRM_<Voltage Processor name>_VSTEPMIN[23:8] SMPSWAITTIMEMIN	xx(2)
Set SMPS minimum voltage (VDD) step size. 0 ≤ ΔVdd(4) ≤ VStepMin	PRCM.PRM_<Voltage Processor name>_VSTEPMIN[7:0] VSTEPMIN	xx(2)
Set SMPS positive voltage step slew rate (in number of cycles per SMPS step).	PRCM.PRM_<Voltage Processor name>_VSTEPMAX[23:8] SMPSWAITTIMEMAX	xx(2)
Set SMPS maximum voltage (VDD) step size. ΔVDD(4) > VStepMax	PRCM.PRM_<Voltage Processor name>_VSTEPMAX[7:0] VSTEPMAX	xx(2)
Set SMPS minimum voltage level.	PRCM.PRM_<Voltage Processor name>_VLIMITTO[23:16] VDDMIN	xx(2)
Set SMPS maximum voltage level.	PRCM.PRM_<Voltage Processor name>_VLIMITTO[31:24] VDDMAX	xx(2)

(1) ErrorOffset is an 8-bit two's complement signed frequency error and adding 1-bit is equivalent to adding 0.79% to the frequency error.
(2) Depends on the characteristics of the SMPS
(3) Recommended value for Error2voltage gain is approximately 0.004V/% error.
(4) ΔVdd = (FreqError + ErrorOffset) * Error2VoltageGain. FreqError is a two complement value fixed-point fraction, MSB is a signed bit.

3.10.4.1.4.2 Subsequence – FSM Configuration

This procedure configures the FSM of the voltage processor.

Table 3-330. FSM Configuration

Step	Register/Bit Field/Programming Model	Value
Set maximum length of time to wait for the command acknowledge from the SMPS.	PRCM.PRM_<Voltage Processor name>_VLIMITTO[15:0] TIMEOUT	xxxx(1)
Set target initial voltage level of the SMPS.	PRCM.PRM_<Voltage Processor name>_CONFIG[15:8] INITVOLTAGE	xx
Assert the initial voltage into the voltage processor FSM.	PRCM.PRM_<Voltage Processor name>_CONFIG[2] INITVDD	0x1

(1) Depends on the characteristics of the SMPS

PRELIMINARY

3.10.4.1.5 Voltage Controller Initialization

This procedure initializes the voltage controller.

Table 3-331. Voltage Controller Module Initialization

Step	Register/Bit Field/Programming Model	Value
Configure external power IC device I^2C slave addresses. 7 bits for each SMPS IC: [20:14] SMPS2, [13:7] SMPS1, [6:0] SMPS0.	PRCM.PRM_VC_SMPS_<Memory Volatge Domain>_CONFIG[6:0] SA_<Voltage Domain name>	xx(1)
Configure voltage configuration register addresses for the VDD channels. Voltage values – 8 bits for each SMPS IC: [23:16] SMPS2, [15:8] SMPS1, [7:0] SMPS0..	PRCM.PRM_VC_SMPS_<Memory Volatge Domain>_CONFIG[15:8] VOLRA_<Voltage Domain name>	xx(1)
Configure command configuration register addresses. Command (ON/ON-Low-Power/Retention). Command values – 8 bits for each SMPS IC: [23:16] SMPS2, [15:8] SMPS1, [7:0] SMPS0.	PRCM.PRM_VC_SMPS_<Memory Volatge Domain>_CONFIG[23:16] CMDRA_<Voltage Domain name>	xx(1) (2)
Configure voltage domain command values. ON/ON-Low-Power/Retention, command values are 8 bits for each channel.	PRCM.PRM_VC_VAL_CMD_<Voltage Domain name>[x] <Command name>	xx(1)
Configure pointers for the VDD channels.	See Section 3.10.4.1.5.1.	
Configure I^2C interface.	See Section 3.10.4.1.5.2.	

(1) Depends on the connectivity characteristics of the external SMPS device. For more information, see the corresponding SMPS reference documents.

(2) Second register address values are useful when the SMPS ICs have different configuration registers to switch ON or OFF, then VDD voltage configuration register.

3.10.4.1.5.1 Subsequence – VDD Channel Pointer Configuration

This procedure configures the FSM of the voltage processor.

Table 3-332. VDD Channel Pointer Configuration

Step	Register/Bit Field/Programming Model	Value
Set slave address pointer for each VDD channel (1 bit per VDD channel) – (0) VDD0, (1) VDD1, (2) VDD2.	PRCM.PRM_VC_SMPS_<Memory Voltage Domain>_CONFIG[24] SEL_SA_<Voltage Domain name>	
Set voltage configuration register address pointer for each VDD channel (1 bit per VDD channel) – (0) VDD0, (1) VDD1, (2)VDD2.	PRCM.PRM_VC_SMPS_<Memory Voltage Domain>_CONFIG[25] RAV_<Voltage Domain name>	
Set command (ON/Retention) configuration register address pointer for each VDD channel (1 bit per VDD channel) – (0) VDD0, (1) VDD1, (2) VDD2.	PRCM.PRM_VC_SMPS_<Memory Voltage Domain>_CONFIG[26] RAC_<Voltage Domain name>	
Select voltage or command configuration register for FSM commands. Enables bits for PIREGSCHRAC usage (1 bit per VDD channel) – (0) VDD0, (1) VDD1, (2) VDD2.	PRCM.PRM_VC_SMPS_<Memory Voltage Domain>_CONFIG[27] RACEN_<Voltage Domain name>	
Set command voltage level selection pointer. ON/ONLP/RET voltage values set selection for each VDD channel (1 bit per VDD channel) (2) VDD2, (1) VDD1, (0) VDD0.	PRCM.PRM_VC_SMPS_<Memory Voltage Domain>_CONFIG[28] CMD_<Voltage Domain name>	

3.10.4.1.5.2 Subsequence – I^2C Configuration

This procedure configures the I^2C in the voltage controller.

3.10.4.2 Disable Sequence for AVS (SmartReflex) and VP

3.10.4.2.1 Disable the Error Generator Module

This procedure disables the Error Genarator Module.

Table 3-334. Disable the Error Generator

Step	Register/Bit Field/Programming Model	Value
Disable the VP BOUND IRQ (1)	SMARTREFLEXn.ERRCONFIG[22] VPBOUNDSINTENABLE	0x0
Disable sensors	SMARTREFLEXn.SRCONFIG[10] SENENABLE	
Disable the Error Generator module	SMARTREFLEXn.SRCONFIG[9] ERRORGENERATORENABLE	

(1) At this stage, it is important to not write 0x1 on bit SMARTREFLEXn.ERRCONFIG[23] VPBOUNDSINTSTATENA

3.10.4.2.2 Disable the Voltage Processor

This procedure disables the Voltage Processor.

Table 3-335. Disable the Voltage Processor

Step	Register/Bit Field/Programming Model	Value
Disable the VP module	PRCM.PRM_<Voltage_Processor_name>_CONFIG[0] VPENABLE	0x0
Wait for VP being idled by pooling bit VPINIDLE to 0x1	PRCM.PRM_<Voltage_Processor_name>_STATUS[0] VPINIDLE	==0x1

3.10.4.2.3 Disable AVS (SmartReflex)

This procedure disables the Adaptive Voltage Scaling (AVS).

Table 3-336. Disable the SmartReflex Module

Step	Register/Bit Field/Programming Model	Value
Enable the MPU Disable Acknowledge IRQ	SMARTREFLEXn. IRQENABLE_SET[0] MCUDISABLEACTINTENASET	0x1
Disable the SmartReflex module	SMARTREFLEXn. SRCONFIG[11] SRENABLE	0x0
Clear the VP BOUND IRQ status bit only if it is set	SMARTREFLEXn. ERRCONFIG[23] VPBOUNDSINTSTATENA	0x1
Disable the following MPU IRQs or at least check these IRQs are not enabled: ACCUM IRQ, VALID IRQ and BOUND IRQ	SMARTREFLEXn. IRQENABLE_CLR[3] MCUACCUMINTENACLR SMARTREFLEXn. IRQENABLE_CLR[2] MCUVALIDINTENACLR SMARTREFLEXn. IRQENABLE_CLR[1] MCUBOUNDSINTENACLR	0x1
Clear the following MPU IRQ statuses: ACCUM IRQ, VALID IRQ and BOUND IRQ	SMARTREFLEXn. IRQSTATUS[3] MCUACCUMINTSTATENA SMARTREFLEXn. IRQSTATUS[2] MCUVALIDINTSTATENA SMARTREFLEXn. IRQSTATUS[1] MCUBOUNDSINTSTATENA	0x1

PRELIMINARY

Table 3-336. Disable the SmartReflex Module (continued)

Step	Register/Bit Field/Programming Model	Value
Wait for the MPU Disable Acknowledge IRQ	SMARTREFLEXn. IRQSTATUS[0] MCUDISABLEACKINTSTATENA	==0x1
Clear the MPU Disable Acknowledge IRQ status	SMARTREFLEXn. IRQSTATUS[0] MCUDISABLEACKINTSTATENA	0x1
Disable the MPU Disable Acknowledge IRQ status	SMARTREFLEXn. IRQENABLE_CLR[0] MCUDISABLEACKINTENACLR	0x1

3.10.4.3 Changing OPP

This procedure allows changing of the voltage of the external SMPS from one OPP to the other. It also covers the programming sequence for ABBLDO if the OPP change requires a change in state of the ABBLDO.

NOTE: When switching from the current OPP to a target OPP, if the clock frequency of the target OPP is less than that of the current OPP, the clock frequency is first switched to the lower frequency of the target OPP, and only then is voltage scaling initiated. However, if the clock frequency of the target OPP is greater than that of the current OPP, voltage scaling is initiated before frequency scaling.

In Table 3-337 and Table 3-338, "xxx" denotes MPU or MM.

Table 3-337. Transition From Nominal/Slow OPP to Fast OPP

Step ID	Step Description	Register/Register Bit Field/Programming Model	Value
1	Disable the SmartReflex module.	SMARTREFLEXn.SRCONFIG[11] SRENABLE and/or [10] SENENABLE	0x0
2	Mask SmartReflex interrupts		
3	Disable the voltage processor module	PRCM.PRM_<Voltage_Processor_Name>_CONFIG[0] VPENABLE	0x0
4	Set the new OPP – Fast OPP	PRCM.PRM_ABBLDO_xxx_CTRL[1:0] OPP_SEL	0x1
5	Set the voltage processor with new voltage level	PRCM.PRM_VP_xxx_CONFIG [15:8] INITVOLTAGE	
6	Triggers a write of the value in the INITVOLTAGE into the voltage processor	PRCM.PRM_<Voltage_Processor_Name>_CONFIG[2] INITVDD	0x1
7	Force update of the SMPS. This command is sent from the Voltage Processor to the Voltage controller. The Voltage controller sends the new voltage to the power IC via the I^2C Interface. In response the Power IC returns the "SMPS ACK" acknowledge signal to the Voltage controller via the I^2C interface.	PRCM.PRM_VP_xxx_CONFIG [1] FORCEUPDATE	0x1
8	The "SMPS ACK" response is then transmitted to the Voltage processor which will start the counter ForceUpdateWait.	PRCM.PRM_VP_xxx_VOLTAGE[31:8] FORCEUPDATEWAIT	
9	When ForceUpdateWait counter expires, VP_xxx_TRANXDONE_ST interrupt status is set.	PRM_IRQSTATUS_MPU and PRM_IRQSTATUS_MPU_2	0x1

PRELIMINARY

Table 3-337. Transition From Nominal/Slow OPP to Fast OPP (continued)

10	Initiate the state change for the ABB LDO	PRCM.PRM_ABBLDO_xxx_CTRL[2] OPP_CHANGE	0x1
11	ABB LDO performs its transition from bypass mode to FBB mode. The transition is complete when SR2_WTCNT_VALUE counter expires. When this counter expires, OPP_CHANGE bit is set to 0 and ABB_xxx_DONE_ST interrupt status is set.	PRCM.PRM_ABBLDO_xxx_SETUP PRCM.PRM_ABBLDO_xxx_CTRL PRM_IRQSTATUS_MPU PRM_IRQSTATUS_MPU_2	
12	Re-enable the SmartReflex module and interrupts	SMARTREFLEXn.SRCONFIG[11] SR_EN	0x1
13	Re-enable the voltage processor (via I^2C commands sent through the voltage controller)		

Table 3-338. Transition From Fast OPP to Nominal OPP

Step ID	Step Description	Register/Register Bit Field/Programming Model	Value
1	Disable the SmartReflex module.	SMARTREFLEXn.SRCONFIG[11] SRENABLE and/or [10] SENENABLE	0x0
2	Mask SmartReflex interrupts		
3	Disable the voltage processor module	PRCM.PRM_<Voltage_Processor_Name>_CONFIG[0] VPENABLE	0x0
4	Set the new OPP – Nominal OPP	PRM_ABBLDO_xxx_CTRL[1:0] OPP_SEL	0x2
5	Initiate the state change for the ABB LDO	PRM_ABBLDO_xxx_CTRL[2] OPP_CHANGE	0x1
6	ABB LDO performs its transition from FBB mode to bypass mode. The transition is complete when PRM_ABBLDO_xxx_SETUP. sr2_wtcnt_value counter expires. When this counter expires, OPP_CHANGE bit is set to 0 and ABB_xxx_DONE_ST interrupt status is set.	PRM_ABBLDO_xxx_SETUP PRM_ABBLDO_xxx_CTRL PRM_IRQSTATUS_MPU PRM_IRQSTATUS_MPU_2	
7	Set the voltage processor with new voltage level.	PRCM.PRM_<Voltage_Processor_Name>_CONFIG[15:8] INITVOLTAGE	
8	Triggers a write of the value in the INITVOLTAGE into the voltage processor	PRCM.PRM_<Voltage_Processor_Name>_CONFIG[2] INITVDD	0x1
9	Force update of the SMPS. This command is sent from the Voltage Processor to the Voltage controller. The Voltage controller sends the new voltage to the power IC via the I^2C Interface. In response the Power IC returns the "SMPS ACK" acknowledge signal to the Voltage controller via the I^2C interface.	PRM_VP_xxx_CONFIG[1] FORCEUPDATE	0x1
10	The "SMPS ACK" response is then transmitted to the Voltage processor which will start the counter ForceUpdateWait.	PRM_VP_xxx_VOLTAGE[31:8] FORCEUPDATEWAIT	
11	When ForceUpdateWait counter expires, VP_xxx_TRANXDONE_ST interrupt status is set.	PRM_IRQSTATUS_MPU and PRM_IRQSTATUS_MPU_2	0x1

PRELIMINARY

Table 3-338. Transition From Fast OPP to Nominal OPP (continued)

12	Re-enable the SmartReflex module and interrupts	SRn.SRCONFIG[11] SR_EN	0x1
13	Re-enable the voltage processor (via I^2C commands sent through the voltage controller)		

When the SMPS ACK is received from the I^2C interface, this ACK signal sets the PRM_IRQSTATUS_MPU/PRM_IRQSTATUS_IPU[14] VC_BYPASS_ST interrupt status. When this interrupt is received, the software starts a counter. At the end of the counter, the VDD_xxx.L supply has reached its final state. Software must set the PRM_ABBLDO_xx_CTRL[2] OPP_CHANGE bit to initiate the state change for the ABB LDO. ABB LDO performs its transition from FBB mode to bypass mode. The transition is complete when the PRM_ABBLDO_xxx_SETUP[15:8] SR2_WTCNT_VALUE counter expires. When this counter expires, the PRM_ABBLDO_xxx_CTRL[2] OPP_CHANGE bit is set to 0, and the status of the ABB_xxx_DONE_ST interrupt is set.

Bits	Field Name	Description	Type	Reset
31	ABB_MM_DONE_ST	MM ABB mode change done. This status is set when OPP_CHANGE bit is cleared by hardware in PRM_ABBLDO_MM_CRTL register. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
30	VC_MM_VPACK_ST	Voltage Controller MM voltage processor command acknowledge status 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
29	VP_MM_TRANXDONE_ST	Voltage Processor MM transaction completion status. This status is set when a transaction is completed in the voltage processor. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
28	VP_MM_EQVALUE_ST	Voltage Processor MM voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
27	VP_MM_NOSMPSACK_ST	Voltage Processor MM timeout event status. This status is set when the timeout occured before the SMPS acknowledge. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
26	VP_MM_MAXVDD_ST	Voltage Processor MM voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by SW. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

PRELIMINARY

3.11.4.2 MPU_PRM Register Description

Table 3-373. PM_MPU_PWRSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4AE0 6300	**Instance**	MPU_PRM
Description	This register controls the MPU domain power state to reach upon a domain sleep transition. If the value programmed in this register correspond to a lower power state than the one programmed in MPU SS for CPU0 and/or CPU1, then value of this register is overwritten in PRCM logic to limit the power state to enter. Even if value of this register is overwitten in PRCM logic, value of this register remains unchanged.		
Type	RW

Bits	Field Name	Description	Type	Reset
31:22	RESERVED		R	0x000
21:20	PERIPHMEM_ONSTATE	PERIPHMEM memory state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
19:18	RESERVED		R	0x0
17:16	AESSMEM_ONSTATE	AESSMEM memory state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
15:11	RESERVED		R	0x00
10	PERIPHMEM_RETSTATE	PERIPHMEM memory state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state.	R	0
9	RESERVED		R	0
8	AESSMEM_RETSTATE	AESSMEM memory state when domain is RETENTION. Read 0x1: Memory bank is retained when domain is in RETENTION state.	R	1
7:5	RESERVED		R	0x0
4	LOWPOWERSTATECHANGE	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.	RW WSpecial	0
3	RESERVED		R	0
2	LOGICRETSTATE	Logic state when power domain is RETENTION Read 0x0: Whole logic is off when the domain is in RETENTION state.	R	0
1:0	POWERSTATE	Power state control 0x0: Reserved 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State	RW	0x0

Bits	Field Name	Description	Type	Reset
31:26	RESERVED		R	0x00
25:24	OCP_NRET_BANK_ONSTATE	OCP_NRET_BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
23:22	IPU_SCACHE_ONSTATE	IPU SCACHE bank state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
21:20	IPU_L2RAM_ONSTATE	IPU L2 bank state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
19:18	CORE_OCMRAM_ONSTATE	OCMRAM bank state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
17:16	CORE_OTHER_BANK_ONSTATE	CORE_OTHER_BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
15:13	RESERVED		R	0x0
12	OCP_NRET_BANK_RETSTATE	OCP_NRET_BANK state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state.	R	0
11	IPU_SCACHE_RETSTATE	IPU SCACHE bank state when domain is RETENTION. 0x0: Memory bank is off when the domain is in the RETENTION state. 0x1: Memory bank is retained when domain is in RETENTION state.	RW	1
10	IPU_L2RAM_RETSTATE	IPU L2 bank state when domain is RETENTION. 0x0: Memory bank is off when the domain is in the RETENTION state. 0x1: Memory bank is retained when domain is in RETENTION state.	RW	1
9	CORE_OCMRAM_RETSTATE	OCMRAM bank state when domain is RETENTION. Read 0x1: Memory bank is retained when domain is in RETENTION state.	R	1
8	CORE_OTHER_BANK_RETSTATE	CORE_OTHER_BANK state when domain is RETENTION. Read 0x1: Memory bank is retained when domain is in RETENTION state.	R	1
7:5	RESERVED		R	0x0
4	LOWPOWERSTATECHANGE	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.	RW WSpecial	0

3.11.13.2 L3INIT_PRM Register Description

Table 3-684. PM_L3INIT_PWRSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4AE0 7600	**Instance**	L3INIT_PRM
Description	This register controls the L3INIT power state to reach upon a domain sleep transition		
Type	RW		

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED												L3INIT_BANK2_ONSTATE		L3INIT_BANK1_ONSTATE		RESERVED							L3INIT_BANK2_RETSTATE	L3INIT_BANK1_RETSTATE	RESERVED			LOWPOWERSTATECHANGE	RESERVED	LOGICRETSTATE		POWERSTATE	

Bits	Field Name	Description	Type	Reset
31:20	RESERVED		R	0x0000
19:18	L3INIT_BANK2_ONSTATE	L3INIT BANK2 state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
17:16	L3INIT_BANK1_ONSTATE	L3INIT BANK1 state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R	0x3
15:10	RESERVED		R	0x00
9	L3INIT_BANK2_RETSTATE	L3INIT BANK2 state when domain is RETENTION. Read 0x1: Memory bank is retained when domain is in RETENTION state.	R	0x1
8	L3INIT_BANK1_RETSTATE	L3INIT BANK1 state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state.	R	0
7:5	RESERVED		R	0x0
4	LOWPOWERSTATECHANGE	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.	RW WSpecial	0
3	RESERVED		R	0
2	LOGICRETSTATE	Logic state when power domain is RETENTION 0x0: Only retention registers are retained and remaing logic is off when the domain is in RETENTION state. 0x1: Whole logic is retained when domain is in RETENTION state.	RW	1
1:0	POWERSTATE	Power state control 0x0: Reserved 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State	RW	0x0

3.11.16.2 WKUPAON_CM Register Description

Table 3-753. CM_WKUPAON_CLKSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4AE0 7900	**Instance**	WKUPAON_CM
Description	This register enables the domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0000
15	CLKACTIVITY_SYS_CLK_ALL	This field indicates the state of the SYS_CLK runing at SCRM level because of any SCRM clock request. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
14	CLKACTIVITY_SYS_CLK_FUNC	This field indicates the state of the functional SYS_CLK clocks in the domain (this exclude activity of EMU_SYS_GCLK clock). [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
13	CLKACTIVITY_WKUPAON_IO_SRCOMP_GFCLK	This field indicates the state of the WKUPAON_IO_SRCOMP_GFCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
12	CLKACTIVITY_L4_WKUPAON_GICLK	This field indicates the state of the WKUPAON_GICLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
11	CLKACTIVITY_WKUPAON_32K_GFCLK	This field indicates the state of the WKUPAON_32K_GFCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
10	RESERVED		R	0
9	CLKACTIVITY_ABE_LP_CLK	This field indicates the state of the ABE_LP_CLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
8	CLKACTIVITY_SYS_CLK	This field indicates the state of the SYS_CLK clock in the domain (it includes profiling, EMU_SYS_GCLK and all functional SYS_CLK). [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
7:2	RESERVED		R	0x00
1:0	CLKTRCTRL	Controls the clock state transition of the WKUPAON clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. Read 0x1: Reserved 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

3.11.18.2 EMU_CM Register Description

Table 3-781. CM_EMU_CLKSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4AE0 7B00	**Instance**	EMU_CM
Description	This register enables the EMU domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain. [warm reset insensitive]		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																							CLKACTIVITY_EMU_SYS_CLK	RESERVED						CLKTRCTRL	

Bits	Field Name	Description	Type	Reset
31:9	RESERVED		R	0x0000000
8	CLKACTIVITY_EMU_SYS_CLK	This field indicates the state of the EMU_SYS_CLK clock in the domain. Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
7:2	RESERVED		R	0x00
1:0	CLKTRCTRL	Controls the clock state transition of the EMU clock domain. Read 0x0: Reserved Read 0x1: Reserved 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x2

Bits	Field Name	Description	Type	Reset
12	VDD_CORE_I2C_DISABLE	This bit allows disabling I2C interface with powerIC for CORE voltage (for debug purpose only). [warm reset insensitive] 0x0: Normal mode: I2C is enabled. 0x1: Debug mode: I2C is disabled.	RW	0
11:10	RESERVED		R	0x0
9	VDD_MM_PRESENCE	This bit control the presence of MM voltage in device. [warm reset insensitive] 0x0: MM voltage is not present as an individual voltage: MM voltage is merged with MPU voltage if VDD_MPU_PRESENCE=1. MM voltage is merged with CORE voltage if VDD_MPU_PRESENCE=0. 0x1: MM voltage is present on the device.	RW	1
8	VDD_MPU_PRESENCE	This bit control the presence of MPU voltage in device. [warm reset insensitive] 0x0: MPU voltage is not present as an individual voltage: MPU voltage is merged with MM voltage if VDD_MM_PRESENCE=1. MPU voltage is merged with CORE voltage if VDD_MM_PRESENCE=0. 0x1: MPU voltage is present on the device.	RW	1
7:6	RESERVED		R	0x0
5:4	AUTO_CTRL_VDD_MM_L	This bit field specifies the state to which the hardware can automatically transition the VDD_MM_L voltage domain. 0x0: Voltage domain transitions are disabled. 0x1: Voltage domain transitions to SLEEP are enabled. 0x2: Voltage domain transitions to RET are enabled. Read 0x3: reserved	RW	0x0
3:2	AUTO_CTRL_VDD_MPU_L	This bit field specifies the state to which the hardware can automatically transition the VDD_MPU_L voltage domain. 0x0: Voltage domain transitions are disabled. 0x1: Voltage domain transitions to SLEEP are enabled. 0x2: Voltage domain transitions to RET are enabled. Read 0x3: reserved	RW	0x0
1:0	AUTO_CTRL_VDD_CORE_L	This bit field specifies the state to which the hardware can automatically transition the VDD_CORE_L voltage domain. 0x0: Voltage domain transitions are disabled. 0x1: Voltage domain transitions to SLEEP are enabled. 0x2: Voltage domain transitions to RET are enabled. Read 0x3: reserved	RW	0x0

Table 3-806. PRM_IO_PMCTRL

Address Offset	0x0000 0020		
Physical Address	0x4AE0 7C20	**Instance**	DEVICE_PRM
Description	This register allows controlling power management features of the IOs.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED															GLOBAL_WUEN	RESERVED						WUCLK_STATUS	WUCLK_CTRL	RESERVED		IO_ON_STATUS	ISOOVR_EXTEND	RESERVED		ISOCLK_STATUS	ISOCLK_OVERRIDE

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0000
16	GLOBAL_WUEN	Global IO wakeup enable. This is a gating condition to all individual IO WUEN coming from control module. Gating is done in the Spinner logic. 0x0: All individual IO WUEN are gated in the Spinner logic (overriden to 0). 0x1: All individual IO WUEN from control module are going to IOs.	RW	0
15:10	RESERVED		R	0x00
9	WUCLK_STATUS	Gives value of WUCLKOUT signal coming back from IO pad ring.	R	0
8	WUCLK_CTRL	Direct control on WUCLKIN signal to IO pad ring. 0x0: WUCLKIN signal is driven to 0. IO wakeup daisy chain is functional as well as IO whose wakeup feature is enabled. 0x1: WUCLKIN signal is driven to 1. IO wakeup daisy chain is reset and is latching current pad states and WUEN inputs.	RW	0
7:6	RESERVED		R	0x0

3.11.25.2 DSP_CM_CORE_AON Register Description

Table 3-1040. CM_DSP_CLKSTCTRL

Address Offset	0x0000 0000		
Physical Address	0x4A00 4400	**Instance**	DSP_CM_CORE_AON
Description	This register enables the DSP domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain.		
Type	RW

Address Offset	0x0000 0030		
Physical Address	0x4A00 8630	**Instance**	COREAON_CM_CORE
Description	This register manages the SMARTREFLEX_MM clocks.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED														IDLEST		RESERVED								MODULEMODE							

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0000
17:16	IDLEST	Module idle status. [warm reset insensitive] Read 0x0: Module is fully functional, including INTRCONN Read 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion Read 0x2: Module is in Idle mode (only INTRCONN part). It is functional if using separate functional clock Read 0x3: Module is disabled and cannot be accessed	R	0x3
15:2	RESERVED		R	0x0000
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x0: Module is disable by SW. Any INTRCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). Read 0x1: Reserved 0x2: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guarantied to stay present. As long as in this configuration, power domain sleep transition cannot happen. Read 0x3: Reserved	RW	0x0

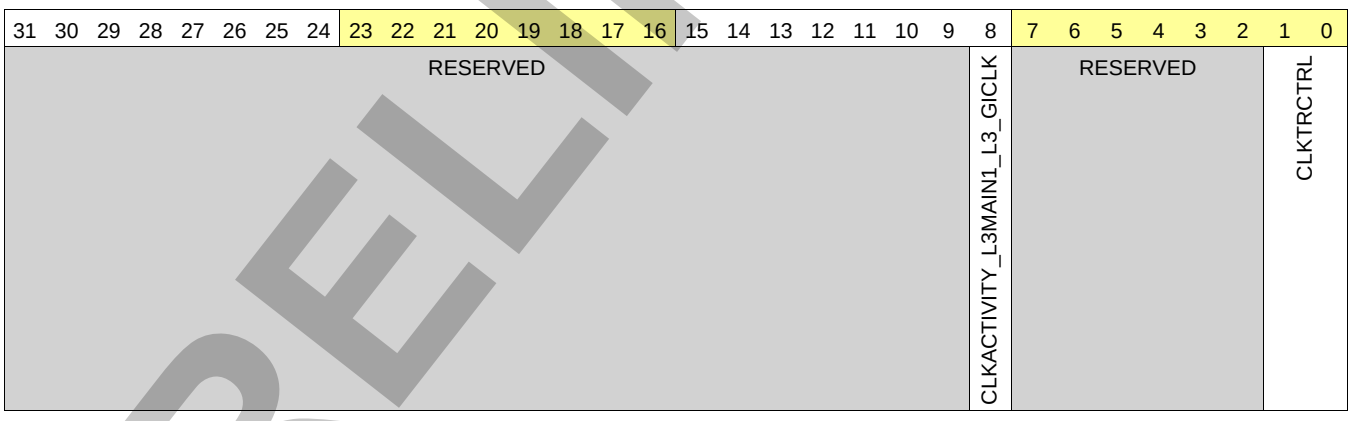
3.11.32.2 CORE_CM_CORE Register Description

Table 3-1155. CM_L3MAIN1_CLKSTCTRL

Address Offset	0x0000 0000
Physical Address	0x4A00 8700 **Instance** CORE_CM_CORE
Description	This register enables the domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain.
Type	RW



Bits	Field Name	Description	Type	Reset
31:9	RESERVED	Reserved	R	0x000000
8	CLKACTIVITY_L3MAIN1_L3_GICLK	This field indicates the state of the L3MAIN1_L3_GICLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is on-going	R	0
7:2	RESERVED	Reserved	R	0x00

PRELIMINARY

Copyright © 2013, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
1:0	CLKTRCTRL	Controls the clock state transition of the L3_MAIN1 clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. Read 0x1: Reserved Read 0x2: Reserved 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

Table 3-1328. Register Call Summary for Register CM_CAM_CLKSTCTRL

Clock Management Functional Description • Clock Domain Modes: [0] [1] [2] [3] [4] [5]
PRCM Register Manual • CAM_CM_CORE Register Summary: [6]

Table 3-1329. CM_CAM_STATICDEP

Address Offset	0x0000 0004		
Physical Address	0x4A00 9304	**Instance**	CAM_CM_CORE
Description	This register controls the static domain depedencies from CAM domain towards 'target' domains. It is relevant only for domain having system initiator(s).		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
4	EMIF_STATDEP	Static dependency towards EMIF clock domain 0x0: Dependency is disabled 0x1: Dependency is enabled	RW	0
3	RESERVED		R	0
2	IVA_STATDEP	Static dependency towards IVA clock domain 0x0: Dependency is disabled 0x1: Dependency is enabled	RW	0
1:0	RESERVED		R	0x0

Table 3-1330. Register Call Summary for Register CM_CAM_STATICDEP

Clock Management Functional Description • Static Dependency: [0] [1] [2] [3]
PRCM Register Manual • CAM_CM_CORE Register Summary: [4]

Table 3-1331. CM_CAM_DYNAMICDEP

Address Offset	0x0000 0008		
Physical Address	0x4A00 9308	**Instance**	CAM_CM_CORE
Description	This register controls the dynamic domain depedencies from CAM domain towards 'target' domains. It is relevant only for domain having INTRCONN master port(s).		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																									L3MAIN2_DYNDEP	RESERVED					

Bits	Field Name	Description	Type	Reset
31:7	RESERVED		R	0x0000000
6	L3MAIN2_DYNDEP	Dynamic dependency towards L3_MAIN2 clock domain Read 0x0: Dependency is disabled	R	0
5:0	RESERVED		R	0x00

Table 3-1332. Register Call Summary for Register CM_CAM_DYNAMICDEP

Clock Management Functional Description • Dynamic Dependency: [0]
PRCM Register Manual • CAM_CM_CORE Register Summary: [1]

Table 3-1333. CM_CAM_ISS_CLKCTRL

Address Offset	0x0000 0020		
Physical Address	0x4A00 9320	**Instance**	CAM_CM_CORE
Description	This register manages the ISS clocks.		
Type	RW

RESERVED													STBYST	IDLEST		RESERVED							OPTFCLKEN_CTRLCLK	RESERVED						MODULEMODE	

Bits	Field Name	Description	Type	Reset
31:19	RESERVED		R	0x0000
18	STBYST	Module standby status. [warm reset insensitive] Read 0x0: Module is functional (not in standby) Read 0x1: Module is in standby	R	1
17:16	IDLEST	Module idle status. [warm reset insensitive] Read 0x0: Module is fully functional, including INTRCONN Read 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion Read 0x2: Module is in Idle mode (only INTRCONN part). It is functional if using separate functional clock Read 0x3: Module is disabled and cannot be accessed	R	0x3
15:9	RESERVED		R	0x00
8	OPTFCLKEN_CTRLCLK	Optional functional clock control for CSI_PHY_GFCLK 96Mhz clock. 0x0: Optional functional clock is disabled 0x1: Optional functional clock is enabled	RW	0
7:2	RESERVED		R	0x00
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x0: Module is disable by SW. Any INTRCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). Read 0x1: Reserved 0x2: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guarantied to stay present. As long as in this configuration, power domain sleep transition cannot happen. Read 0x3: Reserved	RW	0x0
